CONTENTS

OF THE

REGISTRAR GENERAL'S ANNUAL REPORT FOR 1873.

REPORT :—

	PAGES
GENERAL REVIEW of FACTS for the Year	v
EMIGRATION from the UNITED KINGDOM	v
INCREASE of POPULATION and INFLUENCE of EMIGRATION thereon	v-vi
METEOROLOGY at GREENWICH ; PRICES of WHEAT, MEAT and POTATOES ; and PAUPERISM	vi-vii
MARRIAGES. Number celebrated according and <i>not</i> according to the Rites of the Established Church ; Conditions of Persons married ; Ages of Persons married ; Marriages of Minors ; Signatures of Marriage Registers ; Educational condition of different Counties, as shown by the Signatures of Marriage Registers ; Buildings registered for the Solemnization of Marriages ; Certified Places of Worship ; Designations of Religious Bodies	vii-xi
BIRTHS. Number registered ; Birth-rate ; Sex ; Children born <i>in</i> and <i>out of</i> Wedlock	xi-xii
DEATHS. Number registered ; Death-rate ; Sex ; Age ; Mortality of Males and Females at various Ages ; Seasons ; Locality ; Death-rate of Children under Five Years of Age, and under One Year of Age ; Mortality from Fever in large Towns ; Deaths in Public Institutions	xiii-xviii
PUBLIC HEALTH ACT	xiii
PROGRESS of REGISTRATION. Aggregate Number of NAMES on the REGISTERS, Particulars as to the Alphabetical Index to the Names, and NUMBER of SEARCHES in the Registers and of CERTIFICATES granted at the CENTRAL OFFICE	xviii
UNITED KINGDOM. Population, Emigration, Marriage, Birth, and Death Rates	xviii-xix
THE ARMY. STRENGTH and MORTALITY of the ARMY at HOME and ABROAD	xix
THE NAVY. STRENGTH and MORTALITY of the NAVY	xix-xx
BIRTHS and DEATHS of BRITISH SUBJECTS at SEA ; MARINE REGISTER BOOK ; MORTALITY by DROWNING in the MERCHANT SERVICE compared with that in the ROYAL NAVY	xx-xxi
WILLS. Calendars of Grants of Probate and Administration kept at the General Register Office ; Numbers and Values of Probates and Administrations	xxii
EUROPEAN STATES. Marriage, Birth, and Death Rates ; and Increase or Decrease of Population	xxii-xxv
SUMMARY of the QUARTERLY REPORTS :—	
FIRST QUARTER, ending 31st March	xxvi-xxxiii
SECOND QUARTER, ending June 30th	xxxiii-xli
THIRD QUARTER, ending September 30th	xli-xlvi
FOURTH QUARTER, ending December 31st	xlix-lvi
HEALTH of LONDON and of other large Cities	lv-lxii
METEOROLOGY ; Remarks by James Glaisher, Esq., F.R.S.	lxiii-lxiv
PRELIMINARY TABLES	lxvi-cxxviii

ABSTRACTS :—

MARRIAGES Registered in England in each of the Registration Divisions and Counties, and Districts ; distinguishing those according and those <i>not</i> according to the Rites of the Established Church ; in each quarter of the year ; and distinguishing also Persons married according to their conjugal Condition, Minority, and Signature of the Register by marks	2-25
AGES of 300,262 Persons married, distinguishing those of Bachelors, Spinsters, Widowers, Widows	26-28

ABSTRACTS—*continued.*

	PAGES
MARRIAGES, BIRTHS, and DEATHS Registered, and Excess of Births over Deaths, in each of the Divisions, Counties, and Districts; also BIRTHS and DEATHS and EXCESS of BIRTHS over DEATHS in each of the Sub-districts of England; distinguishing the Sexes and Illegitimate Births throughout	30-84
BIRTHS Registered in the DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters	86-89
BIRTHS of Children born out of Wedlock Registered in the DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters	90-93
DEATHS Registered in DIVISIONS and COUNTIES (distinguishing Males and Females) in each of the Four Quarters	94-97
DEATHS of Males and Females in Public Institutions	99-118
DEATHS of Males and Females at different AGES Registered in DIVISIONS, COUNTIES, and DISTRICTS	120-141
CAUSES of DEATH of Males and Females in ENGLAND at different Periods of Life	144-149
SUPPLEMENTARY TABLE of CAUSES of DEATH of Males and Females in England at different Periods of Life	150-153
CAUSES of DEATH of Males and Females in LONDON at different Periods of Life	154-159
CAUSES of DEATH of Males and Females in ENGLAND, and in each of the DIVISIONS and COUNTIES	160-183
DEATHS from SEVERAL ZYMOTIC and OTHER CAUSES, and INQUEST CASES, in the DIVISIONS, COUNTIES, and DISTRICTS of ENGLAND	184-195
VIOLENT DEATHS in ENGLAND, distinguishing SEX and AGE	196-200
VIOLENT DEATHS in each of the ELEVEN DIVISIONS of ENGLAND, distinguishing SEX	201-205
DEATHS returned as having occurred from SUICIDE in ENGLAND, distinguishing SEX and AGE	206-207
DEATHS returned as having occurred from SUICIDE in each of the ELEVEN DIVISIONS of ENGLAND, distinguishing SEX	208-209
DEATHS returned as having occurred from MURDER and INFANTICIDE in ENGLAND, distinguishing SEX and AGE	210-211
DEATHS returned as having occurred from MURDER and INFANTICIDE in each of the ELEVEN DIVISIONS of ENGLAND, distinguishing SEX	212
DEATHS returned as having occurred from MANSLAUGHTER in ENGLAND, distinguishing SEX and AGE	213-214
DEATHS returned as having occurred from MANSLAUGHTER in each of the ELEVEN DIVISIONS of ENGLAND, distinguishing SEX	215

APPENDIX.

LETTER TO THE REGISTRAR-GENERAL ON THE CAUSES OF DEATH IN ENGLAND, BY WILLIAM FARR, Esq., M.D., F.R.S. :—

CAUSES OF DEATH :—

(1) <i>Zymotic Diseases</i>	219-220
(2) <i>Constitutional Diseases</i>	220
(3) <i>Local Diseases</i>	221
(4) <i>Developmental Diseases</i>	221-222
(5) <i>Violence</i>	222-223

TABLES	224-247
------------------	---------

DEATHS from DIFFERENT CAUSES in ENGLAND in each of the Eight Years 1866-73, classified according to the Nomenclature adopted by the ROYAL COLLEGE OF PHYSICIANS	248-265
INDEX of DISTRICTS, SUB-DISTRICTS, and of certain TOWNS, referring to Numbers used in the several TABLES of ABSTRACTS	267-281
ALPHABETICAL INDEX to REPORT, TABLES, and APPENDIX	282-295

REPORT

TO

The Right Honourable GEORGE SCLATER-BOOTH, M.P.,
President of the Local Government Board, &c. &c.

*General Register Office, Somerset House,
11th August 1875.*

(1873.)

SIR,

I HAVE the honour to submit to you my Report on the Registration of Marriages, Births, and Deaths for the year 1873.

The statistics relating to the three great events of life—marriage, birth, and death—together with the causes which have regulated their numbers and proportions in different parts of the country have been briefly reviewed.

These results of civil registration show that the conditions of the year were favourable to the public health. Employment was abundant, and wages were good, and the people married in unusual proportions. The birth-rate was high, while the death-rate of the year, with only three exceptions, was the lowest on record.

Sanitary jurisdictions are now established all over the country and many hundreds of the medical profession acting as officers of health, are devoting their professional abilities to the advance of sanitary work, ascertaining the causes of sickness and death that are within their control, and adopting measures for the prevention of disease.

The Annual Reports of the medical officers of health for the large towns already bear witness to ability and success in the great work which they have undertaken, and I hope to see the results of their labours recorded in a still more satisfactory reduction of the death-rates of the country.

Increase of Population.—The excess of registered births over the registered deaths in the year 1873 was 337,258. The number of English emigrants returned by the Marine Department of the Board of Trade was 128,271, but the numbers who returned to these shores were not recorded; if they were—assuming civil registration to be nearly perfect, as it will be soon after the operation of the new registration Act in 1875—the means would exist for determining the actual increase of population in each year from the recorded facts. At present the population is estimated from the rate of increase observed in the thirty years 1840–71. By this estimate it amounted at the middle of 1873 to 23,356,414.

The powers and duties conferred and imposed on the Emigration Commissioners have, by the Merchant Shipping Act of 1872, been transferred from 1st January 1873 to the Board of Trade. According to the report prepared by the Marine Department, 310,612 emigrants left the ports of the United Kingdom in the year 1873, including 128,271 English, 22,041

Scotch, 85,670 Irish, and 74,630 Foreigners. 10,069 emigrants whose birthplaces were not distinguished, are proportionally distributed. The total loss by emigration exceeded that of 1872 by 15,399 persons. The proportional number of Irish emigrants is still much greater than that of English or Scotch. There was a decrease in the number of Foreigners compared with 1872 of 5926.

Of the 310,612 emigrants, 233,073 went to the United States, 37,208 to British North America, 26,428 to the Australian Colonies, and 13,903 to all other places.

Meteorology.—There is nothing very remarkable to record in the meteorological elements of the year 1873. The rain-fall was 23·4 inches, or 0·6 inches below the average. The 10th of December was remarkable for its low temperature all over the country. Three days of extreme low temperatures in London were distinguished by the presence of a dense fog. The mean temperature of the year at the Royal Observatory, Greenwich, was 48°·9, or ·5° below the average. The meteorology of the year is ably described by Mr. Glaisher, F.R.S., in his remarks on pp. lxiii–lxiv. See also Tables, pp. xcvi–ci.

Prices.—During the last three months of 1873 there was a marked and extensive fall in the prices of coal and iron, and in a large class of commodities entering into manufactures.

The year 1873 may be said to have been a period of reaction from the high prices and excited demand of 1871, and more particularly from the high prices and wages of 1872.

The heavy rains in the autumn of 1872 were most disastrous to the cereal crops, and it was not until the latter part of January 1873 that farmers could make any appreciable progress in out-door operations. The fine harvest time in 1873 did not compensate for the bad seed time of autumn, and the late frosts of a dreary spring, so there was a deficiency in the yield of wheat. The year 1873 was remarkable for the increase in its wheat imports. The quantity imported for home consumption was 43,863,098 cwts., against 42,127,726 cwts. in 1872. In 1870 only 30,901,229 cwts. were imported; in 1871 the quantity was 39,389,803 cwts.

Butchers meat continued to advance in price, and beef by the carcase at the Metropolitan meat market ranged from 5½*d.* per lb. for inferior quality to 8½*d.* per lb. for superior quality. Mutton ranged from 6¼*d.* per lb. for inferior quality to 9*d.* for superior quality.

It has been shown that during the twenty years ending 31st December 1873 wheat had risen 23 per cent. in price, beef 50 per cent., mutton 40 per cent., and potatoes 31 per cent., and confining the observations to more recent periods, the average prices in the three years 1868–70, and in the three years 1871–73 it is found that wheat had risen about 9 per cent., beef 13 per cent., mutton 20 per cent., and potatoes 7 per cent.

INCREASE per Cent. in the PRICES of WHEAT, BEEF, MUTTON, and POTATOES,
1868–70 and 1871–73.

PERIODS.	Wheat, per Quarter.	Beef, per Lb.	Mutton, per Lb.	Potatoes, per Ton.
	Shillings.	Pence.	Pence.	Shillings.
1868–70 - -	52·92	5·92	6·13	113·83
1871–73 - -	57·53	6·67	7·38	122·33
Increase per cent. -	8·71	12·67	20·39	7·47

That the rise in the price of commodities has been to some extent counterbalanced by a rise in the price of wages is a fact generally admitted; the labouring class have had it placed within their means to improve their condition in some respects, and there has been a general rise in the scale of living, still the fact remains that the rise in price in these important necessities of life—wheat, meat, and potatoes—has rendered the difficulty of living much greater than it was in former years.

Pauperism.—The annexed results of a census of paupers on the 31st December 1871-2-3,—excluding lunatics in asylums and vagrants,—from the report of the Local Government Board, show a still further decrease in the pauperism of the country.

		In-door.	Out-door.	Total.
1871	-	150,093	780,809	930,902
1872	-	147,657	690,979	838,636
1873	-	144,201	637,269	781,470

The decrease from 1872 to 1873 was 57,166 or 6·8 per cent., and from 1871 to 1873 it was 149,432 or 16·1 per cent.

The average number of paupers receiving relief on the last day of each week amounted to 137,775 in-door, and 656,843 out-door, against 137,278 in-door, and 714,970 out-door in the previous year.

MARRIAGES.

The deduction to be drawn from a review of the marriage returns for the year 1873 is one of general prosperity. Although provisions were dear, work was not scarce, and 205,615 weddings were celebrated, or 8696 more persons were married than in 1872, when the marriage-rate was high.

Years.		Persons married to 1000 persons living.
1869	-	15·9
1870	-	16·1
1871	-	16·7
1872	-	17·5
1873	-	17·6

The marriage-rate (persons married to 1000 population) in 1873 was 17·6, or ·8 above the mean of the last ten years.

The rate was highest in those counties where the greater proportion of the population is engaged in mining and commercial industry, viz., Northumberland 21·7, Stafford 20·8, Nottingham 20·5, Durham 20·4, Lancaster 20·2, East Riding of York 20·0, London 19·9, West Riding of York 19·6, Monmouth 19·3, South Wales 19·1, Leicester 18·8, Gloucester 18·6, Derby 18·4, Warwick 17·9. The rate was lowest in the agricultural counties, viz., Middlesex (extra-metropolitan) 10·6, Hereford 11·6, Hertford 12·2, Surrey (extra-metropolitan) 12·4, Essex 12·7, Salop 12·9, Westmorland 12·9, Wilts 13·1, Dorset 13·3, Rutland 13·5, Buckingham 13·9, Somerset 13·9.

In London, the South-eastern counties, the extra-metropolitan part of Middlesex, in Hertfordshire, Bedfordshire, Cambridgeshire, Wiltshire, Dorsetshire, Devonshire, Herefordshire, Shropshire, and Westmorland, the marriage-rate was below the mean of the ten previous years.

Forms of Marriage.—The marriages according to the rites of the Church of England twenty-five years ago were 123,182 or 87 per cent. of the total marriages. In 1873 they were 154,581 or 75 per cent. This decrease, as has been pointed out in previous reports, is chiefly accounted

for by the increasing number of marriages without religious ceremony at Superintendent Registrars' Offices. The number of marriages at these offices in 1849 was 5558 or 4 per cent. of the total marriages, whereas in 1873 it had increased to 21,178 or 10 per cent. The marriages not according to the rites of the establishment in 1849 were 18,701 or 13 per cent., in 1873 they had increased to 51,034 or 25 per cent.

Of 100 couples who married in 1873 according to the rites of the Established Church 101 married by special license, 11 by license, 85 after banns, and 3 by Superintendent Registrars' certificate, while in nearly 1 per cent. the clergy omitted to state under which of the foregoing heads the marriages should be classed. Of 100 weddings not according to the rites of the Church there were 16 in Roman Catholic chapels, 41 in registered places belonging to various Christian denominations, 2 among Quakers, 9 among Jews, and 41 at Superintendent Registrars' Offices.

First Marriages ; Re-marriages.—167,987 bachelors married spinsters during the year, 9559 bachelors married widows, 16,918 widowers married spinsters, and 11,151 widowers married widows ; so 48,779 persons married who had been previously wedded, against 47,359 in the previous year.

The registers at this office record the number of marriages of divorced persons in each year : the number registered in 1873 was 62, viz., 59 in which one or other of the contracting parties is stated to have been previously divorced, and 3 in which divorced men married divorced women. Of 33 divorced men who re-married, 26 married spinsters, 4 married widows, and 3 married divorced women. Of 32 divorced women who re-married, 20 were married to bachelors, 9 were married to widowers, and 3 were married to divorced men.*

The proportional number of divorced persons who re-married to every 10,000 persons married was 1.58 in 1873, the average for the ten previous years being 1.04.

Ages at Marriage.—The Census returns of 1871 relating to conjugal condition enabled me to show, in my last report, the annual rate of marriage at each year of age under 21, and to discuss the question as to the tendency to later or earlier marriage among the population of this country. The results relating to the marriage of minors in the different counties are instructive, bearing as they do on the social condition of the population ; they should be studied in connection with the occupations.

Of the 205,615 men who married in 1873 the ages of 150,131 were ascertained, and of that number 15,842 were of the ages 15 and under 21, but in addition to this number 1024 males married whose precise ages were not stated, but who were described in the registers as "minor" or "under age," so that the total number of males married under 21 years of age was 16,866. Of the 205,615 women who were married the ages of 150,131 were ascertained, and of this number 40,435 were of the ages 15 and under 21 ; 5762 were simply described as "minors" or "under age," the total number of females who married under 21 years of age was, therefore, 46,107. Thus of every 100 men married 8.2 were not of full age, and of every 100 women who were married 22.4 were not of full age. In the previous year the proportions per cent. were 8.0 and 22.3, respectively. The ratio has nearly doubled during the last thirty years.

The mean age at marriage of 150,131 persons whose ages at marriage were stated, in the year 1873, including the re-married, was 27.8 years

* The number of decrees of divorce pronounced by Her Majesty's Court for Divorce and Matrimonial Causes in the year 1873 was, nisi 272, absolute 215.

for men, and 25·6 years for women; these results are nearly the same as those of the previous year. The mean age at marriage of 131,347 bachelors was 25·6 years, against 25·7 in 1872, and the mean age at marriage of 135,970 spinsters was 24·2 against 24·6 in 1872.

The mean age at marriage, therefore, of bachelors and spinsters was rather lower than in the previous year and indicates an increasing tendency to early marriage, but the excess of births over deaths raises the proportion of persons living at the early ages, so that the mean age of marriage in an increasing population is rather understated.

Of 14,161 widows who re-married in 1873 and whose ages at marriage were stated, fifteen were under 20 years of age, viz., one aged 17 years, one aged 18 years, and thirteen aged 19 years.

As a general rule the proportional number of minors who marry is lowest in those counties where skilled labour is least in demand. Thus in the following counties, &c. the proportions per cent. among males were low. Hereford 1·9, Surrey (extra-metropolitan) 3·5, Rutland 3·8, Hants 4·2, Middlesex (extra-metropolitan) 4·3, Salop 4·3, North Wales 4·5, Westmorland 5·1, Kent (extra-metropolitan) 5·2, Berks 5·2, Dorset 5·3, Cumberland 5·5, Sussex 5·8, and Devon 5·8. The rate was highest among males, in Bedford 16·0, Leicester 13·8, Nottingham 13·4, Stafford 13·2, Derby 12·2, West Riding 11·5, Northampton 11·0, Lancaster 10·5, Warwick 10·1, Monmouth 10·1.

Among females the ratio was highest in the counties of Durham 33·4, Stafford 32·5, Derby 29·8, West Riding of York 29·4, East Riding (with York) 28·1, Monmouth 28·1, Leicester 27·9, Nottingham 27·4, and Northampton 25·2. The rate was lowest in North Wales 12·5, Salop 13·0, London 13·1, Hereford 13·6, Surrey (extra-metropolitan) 13·9, Cumberland 14·2.

Of the 205,615 marriages contracted in 1873, 167,987 or 81 per cent. were between bachelors and spinsters, 9559 or 4·6 per cent. were between bachelors and widows, 16,918 or 8·2 per cent. were between widowers and spinsters, and 11,151 or 5·4 per cent. were between widowers and widows, so 28,069 of the *men* who married, or 13·7 per cent., were widowers, and 20,710 of the *women* who married, or 10·2 per cent., were widows.

Signature in Marriage Registers.—The state of elementary education among the people as indicated by the proportion of men and women who signed their names in writing in 1873, shows a slight improvement compared with the results of the previous year, but a comparison of the proportions in 1873 with those in 1864 shows that education is in a much more advanced state now than it was 10 years ago. Of 100 men who married in 1873, 81·2 per cent. were able to write, and of 100 women who married the proportion was 74·6. In the previous year the proportional numbers were 80·6 and 73·7 respectively. In every 10,000 men, therefore, who married in 1873, 60 more, and of every 10,000 women 90 more, signed their names in writing than was the case in 1872.

In Monmouthshire only 64 *men* out of every 100 were able to write, in Staffordshire the proportion was 65, in Hertfordshire and Wales 71, and in Norfolk, Suffolk, and Shropshire 72.

But education has been most neglected among women, for in South Wales only 56 *women* out of every 100 were able to write, in Staffordshire the proportion was 58, Monmouthshire 61, North Wales 63, Lancashire 64, West Riding of York 66, Durham 67, Bedford 68.

The annexed results indicate the relative progress that has been made during the last ten years in some of the counties of England and Wales; the greatest improvement having taken place in those counties where there was most room for improvement.

INCREASE during the last Ten Years, 1864-73, in the NUMBER of PERSONS who
SIGNED the MARRIAGE REGISTER in WRITING.

Counties, &c. showing the Greatest Improvement.

MALES.				FEMALES.			
			Per cent.				Per cent.
Rutland	-	-	16·2	Huntingdonshire	-	-	13·2
Bedfordshire	-	-	11·3	Bedfordshire	-	-	12·9
Essex	-	-	10·4	Monmouthshire	-	-	12·8
Huntingdonshire	-	-	9·7	South Wales	-	-	11·7
Dorsetshire	-	-	9·1	North Wales	-	-	11·5
South Wales	-	-	8·6	Lancashire	-	-	11·1
Berkshire	-	-	8·1	Cornwall	-	-	10·9
Hertfordshire	-	-	8·1	Worcestershire	-	-	10·3
Middlesex (<i>extra-Metropolitan</i>)	-	-	8·1	Cambridgeshire	-	-	10·1
Suffolk	-	-	8·0	Westmorland	-	-	9·9

Counties, &c. showing the Least Improvement.

MALES.				FEMALES.			
			Per cent.				Per cent.
Warwickshire	-	-	1·7	Rutland	-	-	2·9
Sussex	-	-	2·5	Buckinghamshire	-	-	2·9
London	-	-	2·5	Warwickshire	-	-	3·5
Westmorland	-	-	2·8	Northumberland	-	-	3·7
Durham	-	-	2·8	London	-	-	4·1
Leicestershire	-	-	3·1	Herefordshire	-	-	4·7
Staffordshire	-	-	3·2	Durham	-	-	5·0
Herefordshire	-	-	3·4	Shropshire	-	-	5·3
Northumberland	-	-	3·6	North Riding	-	-	5·4
West Riding	-	-	3·8	Hampshire	-	-	5·4

Thus out of every 100 men married in the county of Bedford, only 63·1 signed their names in writing in the marriage register in 1864, whereas in 1873 the proportional number was 74·4, so that 11·3 per cent. more men were able to sign in 1873 than was the case in 1864.

After making due allowance for differences of sex and age—for in some counties various inducements tend to raise the proportions of the living at ages 21 and under 30 above the normal average—it would be instructive to note the proportional amount of crime in those counties where elementary education has been comparatively neglected.

The effects of recent legislation in meeting the educational wants of the country will not be fully appreciated until the children of the present generation arrive at maturity. The average daily attendance in 1869 of children in schools receiving annual grants was 1,062,999. In 1873 it had risen to 1,482,480, but it is expected that under the operation of the Education Acts this average attendance will greatly increase. At the Census of 1871 it was ascertained that there were 5,374,301 children of the school ages, 3 and under 13; about one-seventh of these, it has been estimated, are children of a class above those who would attend public elementary schools, and assuming, in accordance with a statement in the Education Report, that the children only attend school for 7 years out of the 10, then there should be at least 3,224,580 under instructions in such schools, instead of 1,482,480.*

Buildings registered for Marriages.—The number of these buildings registered in 1873 was 232, bringing up the total number on the register at the end of the year to 7136. Of the 232 registered during the year 9 belonged to Presbyterians, 47 to Independents, 37 to Baptists, 1 to the United Brethren or Moravians, 9 to Roman Catholics, 2 to Unitarians, 100 to the various sects of Wesleyan Methodists, 21 to Calvinistic Methodists, 2 to the New Jerusalem Church, 1 to the Catholic and Apos-

* See Report of the Committee of Council on Education, 1874-5, pp. ix. and xiv.

tolie Church, and 3 to other places of worship. For the distribution of the 7136 buildings now on the register, under the various denominations, see Table 9.

Certified Places of Worship.—The number of places of meeting certified for religious worship during the year 1873 not being churches or chapels of the Established Church was 458. The number on the register on 31st December 1873 was 19,591. The following is a list of the various titles by which religious denominations have been certified to the Registrar General. The names printed in italics have been added since the publication of the list in the last Report.

BIRTHS.

829,778 births were registered in England and Wales during the year 1873. This is the highest number recorded, and exceeds that of the previous year by 3871. In proportion to population it was at the rate of 35·5 per 1000, nearly the same as that of 1872 (35·8) and about the same as the average of the ten previous years (35·3).

The absolute highest ratios of births to population were in the counties, &c. of Durham 45·8, Stafford 42·6, Northumberland 39·4, West Riding of York 38·9, Lancaster 38·9, Monmouth 38·5, Derby 37·6, Warwick 37·5, Leicester 37·4, and Nottingham 37·2. The absolute lowest were in those counties having a low proportion of married women at the child bearing ages, viz., Hereford 27·6, Dorset 28·9, Devon 29·8, North Wales 29·8, Sussex 29·9, and Westmorland 29·9.

Comparing the birth-rate in the different counties in 1873, with the mean rate of ten previous years, it is found that the rate was relatively high

in the counties of Monmouth, in Stafford, and Warwick, in four of the Midland and Eastern Counties, and in nine of the North Midland, North Western, and Northern Counties ; in all the remaining counties the rate was low.

The birth-rate in England still slightly exceeds that of Scotland, while on the other hand, the death-rate is rather lower in England than in Scotland. The average annual rates in the five years 1869-73 were as follows :—

			ENGLAND.	SCOTLAND.
Births	-	-	35·3	34·6
Deaths	-	-	22·0	22·4

A high birth-rate raises the proportional number of children and adults living at ages at which the mortality is low, so a large excess of births over deaths instead of increasing the mortality has the effect of lowering it. Now that the Registration Act of 1874 is in operation by which the parents or other qualified informants are bound under penalties to give the registrars notice of every birth, a comparison of the results of civil registration in the two countries will be still more interesting.

Sex.—More boys than girls are *born* every year, the boys being in the proportion of 104 to every 100 girls. The Census returns of 1871 show that there are 95 males *resident in England* to every 100 females. Including the portion of the army, navy, and merchant seamen abroad belonging to England, the proportional number is 97. This disparity in the proportions of the sexes is attributable to a higher rate of mortality among males, and to an excess of emigration of males over females. The proportions vary in different years and in different counties.

Taking an average of ten years, the highest proportions of boys born were in Cornwall, North Wales, Northumberland, North Riding of York, Durham, Westmoreland, and South Wales.

Children born out of Wedlock.—The number of illegitimate births registered in 1873 was 43,161, representing a proportion of 5·2 per cent. of the total births registered. This is an improvement on the rate of the previous year, when it was 5·4 per cent.

It is noteworthy that the proportional number of registered children born out of wedlock has steadily decreased year by year since 1863, as will be seen by the annexed figures :—

Years.			Children born out of wedlock to every 100 births.
1863	-	-	6·5
1864	-	-	6·4
1865	-	-	6·2
1866	-	-	6·0
1867	-	-	5·9
1868	-	-	5·9
1869	-	-	5·8
1870	-	-	5·6
1871	-	-	5·6
1872	-	-	5·4
1873	-	-	5·2

In the last 29 years the rate has decreased from 7·0 to 5·2 per 100 births, or about 26 per cent. The improvement observed in recent years in the *different counties* was discussed in my two last annual reports.

DEATHS.

Under the Public Health Act of 1848, the Local Government Act of 1858, and the Public Health Act of 1872, 933 *urban* sanitary districts have been established in the municipal boroughs and other towns of England and Wales, and in addition to these there are 590 *rural* sanitary districts under the authority of Boards of Guardians.

In conformity with the terms of the Public Health Act the local sanitary authorities have from time to time appointed medical officers of health* to preside over these 1523 districts, to watch over the health of the people residing within these areas, and to carry on the great work of sanitary reform.

In many of these urban districts there are traces of the good effects of the remedial work of some of these sanitary *præsidia*. Impure water supply has been stopped, overcrowding lessened, defective drainage remedied, and death-rates have consequently been reduced.

But just as the physician, besides being called upon to heal, has sometimes to administer a prophylactic to prevent others being infected, so it will be the duty of local sanitary authorities—acting upon the principle that prevention is better than cure—to appoint medical health officers before the populations have crowded into dense districts, and to watch over the formation of new towns: this is, in fact, the duty of the *rural* sanitary authorities.

When *remedial* measures attacking the existing agencies that are unfavourable to health, and other *preventive* measures are in operation all over the country, the effects will doubtless be made manifest in a more marked reduction of the death-rate of all England; but before all the practical good that is promised can be effected the medical officers of health will probably have to be armed with still greater legislative authority, so that none of their important recommendations may be neglected.

The deaths registered in England and Wales in 1873 were 492,520, a number differing but little from that registered in the previous year. The number in proportion to population was 21·1 per 1000, the mean of the ten previous years being 22·6, the rate of mortality in 1873 was, therefore, 1·5 per 1000 of population below the average, and indicates a more satisfactory state of the public health than that which existed in previous years.

The history of death-rates in the various towns and districts of England has been recorded in my annual reports for a period extending over 36 years, and from time to time it has been pointed out that the variations from such disturbing causes as sex and age are confined within comparatively narrow limits—especially the element of sex—and do not affect the general mortality of *persons at all ages* to such an extent as to interfere with its value as a sure indicator of the prevalence of conditions prejudicial to life; and recent investigations have confirmed this, and shown that the ratio of deaths to population *at all ages* may be taken as a fair indication of the sanitary condition of the population. Wherever the general mortality is high, agencies are to be found at work unfavourable to health, and the town or district requires the attention of the medical officer of health, but statisticians have long considered the general death-rate

* The total number of these officers is unknown, as in appointing medical officers of health the sanitary authorities are only required to report to the Local Government Board those *cases* where it is proposed to obtain repayment of a moiety of the salary of the officer from the Parliamentary grant. The number of *cases*, in which one or more medical officers have been appointed, thus reported up to 31st December 1874 was 727, viz., 360 appointed by rural authorities, 287 by urban authorities, and 80 by combined authorities. In addition to these is a large number of medical officers, unreported. The number of *cases* in which Inspectors of Nuisances have been thus reported was 752.

as only a preliminary test, to be followed up by further research relating to the mortality of children and adults at different ages, and by different diseases.

Sex and Age.—The deaths of 254,985 males and 237,535 females were registered in 1873 being in the proportion of 107 deaths of the former to 100 deaths of the latter. The rate of mortality per 1000 of population was 22·4 for males, and 19·8 for females. The rate varies considerably at the different ages. Among males under 5 years of age it was 66·5 per 1000 living at that age: at the age 5–10 the proportional number was 6·0, and at 10–15, when the mortality of *childhood* reaches its minimum, it was 3·7. After that age the rate increases at each period of age in the tables.

Among females the mortality under 5 years of age was 56·5 per 1000, at 5–10 it was 5·6, and at 10–15 it was 3·6.

The rate of mortality of children (males and females) at each of these three periods of age (0–5, 5–10, and 10–15) was 61·5, 5·8, and 3·6. Comparing these rates with those for the seventeen years 1838–54—on which the English Life Table is based, and which differ but little from the average rates of the twenty-five years 1848–72—the mortality in the year 1873, at these ages, is found to be comparatively low. To what extent the mortality is under or over the average at the different ages will be seen by the subjoined results.

Tables 26 and 27,* which show the rate of mortality at different ages in the Registration divisions and counties of England, will be studied with interest.

* See Preliminary Tables appended, pp. xci. and xcii.

The deaths of children under one year of age, chiefly from premature birth, debility, whooping-cough, convulsive diseases, and diarrhoea (the latter disease often being brought about through bad feeding), contribute largely to increase the general rate of mortality. Of the 492,520 deaths registered in England in 1873 no less than 123,768, or 25 per cent. were those of infants, and this high proportion is greatly exceeded in the large towns. It is gratifying, however, to know that the causes which lead to the regrettable high rate of mortality among children are now receiving full attention from the medical officers of health. Sanitary measures are arresting the ravages of diseases so destructive to childhood, and when the Artisans Dwellings Act comes into operation these officers will be enabled to condemn "unhealthy areas,"* but the unwholesome atmosphere in neighbourhoods that must almost of necessity remain comparatively densely populated, the want of sufficient space round the dwellings of the poor, the absence of proper maternal care in the large manufacturing districts, and other causes so prejudicial to the rearing of children over which the health officer has less control—all these still tend to keep up a high death-rate at the ages under 5, and he will be the greatest sanitary reformer of his age who can most successfully combat the unnatural surroundings which are so prejudicial to childhood in town populations.

Seasons.—In the first quarter of 1873 the health of the people was comparatively good, the annual rate of mortality for the three months being 23·0 per 1000 of population, or 1·9 below the average of 36 years. The mean temperature of the air, and the rain-fall deviated very little from the average. In the second quarter of the year when the mean temperature and the rain-fall were each about one degree below the average, the mortality was also low, being at the annual rate of 20·4, against an average-rate of 22·0. In the third quarter of the year the death-rate (19·5) was also below the average (20·6), the mean temperature and the rain-fall both being about the average. In the last quarter of the year the mortality was at the annual rate of 21·5, differing little from the average of 36 years. The rain-fall was 1·6 inches below the average, the mean temperature was about the average.

Detailed information respecting the meteorology in the four quarters of 1873 is contained in the "Summary of the Quarterly Reports" given in subsequent pages xxvi–lvi, and in Mr. Glashier's remarks on pages lxiii–lxiv.

Locality.—The death-rate of England and Wales in the year 1873 was 21·1 per 1000 of population; the rates differed in the various counties, but only in London, in eleven English counties, and in South Wales was this rate exceeded; in the remaining counties the mortality was below 21 per 1000, and it is noteworthy that the eleven counties showing these comparatively high rates contain the towns of Wolverhampton, Birmingham, Leicester, Derby, Liverpool, Manchester, Salford, Oldham, Bradford, Leeds, Sheffield, Hull, Sunderland, Newcastle-on-Tyne, Carlisle, and Newport.

A comparison of the mortality per 1000 of children under 5 years of age, in each of the 10 years 1841–50, and 1861–70, and in 1873, in these counties, &c. is subjoined.

* Dr. Seaton, the Medical Officer of Health for the borough of Nottingham in a recent report on the sanitary condition of the town states, that much has been done to improve the health of the old town, not only in the sewerage and paving of its filthy courts, but in the pulling down of houses which obstructed the admission of light and air; "that much, however, still remains to be done, may be judged of by the fact that there still exist as many as 8000 'back to back' houses, a great number of which are situated in narrow, unventilated courts, and alleys. All 'back to back' houses are, from a sanitary point of view, to be strongly condemned; their construction is such as to render the free circulation of air impossible."

COUNTIES, &c.	DEATH-RATE of CHILDREN under 5 Years of Age, per 1000 living at that Age.

Comparing the mortality in the two decennial periods an improvement is observed only in Warwick, Lancaster, East Riding of York, and Monmouth.

Although much has been done recently towards improving the sanitary condition of our large towns, the returns for the present year show that there are causes of sickness and death within our control yet to be grappled with. For the death-rates of these towns at all ages in 1873, see the reprint of my annual Summary for London and other large cities, and also the reprint of my Quarterly Returns herewith appended, pp. xxvi-lxii.

Measuring the mortality of infant life (0-1) in some of the large towns by the number of births, it appears that to every 1000 births registered in Bristol there were 157 deaths of infants, in London the proportional number was 159, in Norwich 159, Sunderland 163, Oldham 169, Nottingham 172, Hull 174, Wolverhampton 175, Birmingham 180, Sheffield 180, Salford 185, Newcastle-on-Tyne 186, Leeds 192, Manchester 198, Leicester 213, and Liverpool 213.

A certain amount of mortality over and above that ruling in rural districts—even under the best sanitary organization—will, it is to be feared, remain in the large towns, but by judicious arrangements the mortality among children under 5 years of age might be greatly reduced.

The rate of mortality in fourteen of the large English towns, among children under 5 years of age, in the year 1873, was lowest in Portsmouth 54·1, Norwich is second on the list 57·7, London is third 71·9, then follow Sunderland 74·6, Nottingham 81·8, Oldham 83·5, Liverpool 86·8, Birmingham 88·5, Leeds 90·7, Sheffield (1874) 91·7, Leicester 95·2, Newcastle-on-Tyne 98·7, Salford 98·9, and Manchester 100·5.

As regards Portsmouth the medical officer of health for this borough, in his report for the year 1873, directs attention to the fact that it has a lower general rate of mortality than the other large towns. This was supposed to be owing to the presence of a large number of soldiers and sailors, but in a subsequent report he gives the mortality exclusive of these classes and shows that this assumption was not correct. He states that he believes “the dockyard has a much more decided effect, and that “too in a way which is directly beneficial. A large manufactory giving “steady remunerative employment to 5500 of the better class of artisans, “who, while at work, are not weakened by over-crowding, want of proper “ventilation, and those mechanical conveniences which are frequently “essential to the health of the workmen employed, and which offers no “inducement to the mother to neglect her children during the hours

“ of labour, must have a directly beneficial effect on a large portion of the community; probably in this instance, on at least one fifth of the whole town. In this, the surest of methods, it will reduce mortality. Another cause, I believe, is that the temperature is warmer and more equable than that observed in the other towns, even along the South Coast.”

As has been pointed out in my previous reports some indication of any sanitary improvement in towns is afforded by the mortality at all ages from fever. Liverpool, Leeds, and Manchester are examples of the improvement that can be effected in this respect. The annexed results show to what extent the large towns have suffered from this disease in each of the four years 1870-73; they are arranged in the order of the mortality observed in 1873.

MORTALITY FROM FEVER IN LARGE TOWNS.

Wolverhampton -	62	54	33	83	58	1·17

In the “ Summary of the Quarterly Reports ” subsequently given (pp. xxvi-lxii) will be found detailed remarks upon the sanitary condition of different localities as indicated by their death-rate in each quarter of 1873, together with such conclusions relative to the marriages and births as seemed to be deducible from the observed facts. And with regard to the large cities and towns of the United Kingdom, of which a selection of twenty-one has been made, with London at their head, I have nothing now to add to the comments in the Annual Summary of the Weekly Returns for 1873, hereto appended (pp. lvii-lxii).

Deaths in Public Institutions.—44,480 or 9 per cent. of the total deaths in the year 1873 occurred in 1300 of the principal public institutions in England and Wales. Of these 44,480 deaths, 29,016 or 65 per cent. occurred in 720 workhouses, 11,209 or 25 per cent. in 501 hospitals, and 4255 or 10 per cent. in 79 lunatic asylums. Only those deaths registered in workhouses, hospitals, and lunatic asylums are returned, inasmuch as the mortality of the respective sub-districts in which they are situated is disturbed principally by these three classes of institutions. Of the patients in hospitals the deaths of males are double those of females; probably the occupations of working men render them more liable to disease and injury than the occupations of women. In recent years additional accommodation has been afforded for the sick by means of cottage

hospitals, and to this cause the increase during the last five years in the total number of hospitals, from 241 in 1869, to 501 in 1873, is chiefly attributable. Including these cottage hospitals, where the accommodation for the sick is comparatively small, there was, in England and Wales, one hospital to every 46,620 of population, in London the proportion was one hospital to every 40,928 of population. In the South Eastern Counties the accommodation provided was one hospital for every 25,541 population. To each hospital in each of the other groups of counties the proportion of population was 49,278 in the South Midland, 53,775 in the Eastern, 34,390 in the South Western, 48,889 in the West Midland, 62,397 in the North Midland, 72,913 in the North Western, 69,196 in Yorkshire, 47,791 in the Northern Counties, and 51,854 in Wales.

As explained in an introductory note (p. 99) the Table of deaths registered in the principal public institutions situate within the several districts and sub-districts (pp. 100–118) will afford the means of correcting the death-rates, and so will be invaluable for purposes of local inquiry. Obviously, there is great disparity in the facilities the sick populations of different parts of the country have of access to institutions for the relief of their necessities.

A reprint of the table, published in my annual summary for 1873, showing the number of deaths registered in *all* the public institutions of *London* is appended to this report.* In the 53 weeks of that year 13,101 deaths were registered in 149 public institutions. Of every 1000 of these deaths, 565 occurred in fifty-six workhouses, 5 occurred in twelve prisons, 5 in two military asylums, 317 in thirty-four general hospitals, 45 in twenty-four hospitals for special diseases, 6 in five lying-in-hospitals, 16 in four naval and military hospitals, 10 in three hospitals for foreigners, and 31 in nine lunatic asylums.

PROGRESS OF REGISTRATION.

Names on the Registers, and Searches.—The names of all persons whose marriages, births, and deaths, have been recorded in the registers during the last 36½ years are, for the convenience of public reference, inscribed in alphabetical Indexes deposited at this office.

From the middle of the year 1837 to the end of the year 1865 the Indexes are in *manuscript*. For the years 1866–73, the Indexes are *printed*. 50,493,226 names—of which 1,733,528 were entered in 1873—are now indexed.

The annual number of searches at this office in the five years 1843–7—exclusive of searches in non-parochial registers, and of searches for purposes connected with the Factory Acts—averaged 778, whereas in the five years 1868–72, the average annual number was 15,057. In 1873 the number was 19,907. The amount of fees received and paid into Her Majesty's Exchequer for searches and certificates in the year 1873 was 3,142*l.* 9*s.* 6*d.*

For a complete list of all the public registers and records in my custody, I refer to my 34th Annual Report (pp. xxi–ii).

UNITED KINGDOM.

The population of the United Kingdom estimated by the respective Registrars General of England, Ireland, and Scotland, to the middle of the year 1873 was 32,124,598. The emigration statistics of Ireland show that 90,149 natives left that country during the year 1873, against 78,102 in the previous year. The estimated population of Ireland in 1873 was 5,337,261 or 34,938 less than in the previous year.

* See page c, Table 37.

The number of births registered in Ireland in 1873 was only 144,377 or 27·1 per 1000 of population, the number of deaths registered was 97,537 or 18·3 per 1000. The excess of births over deaths registered was 46,840. The number of marriages returned was only 25,730, the marriage-rate being 9·6 per 1000. The above numbers are considerably understated, and the Registrar General of Ireland in his last report again directs attention to the defective state of civil registration.

The estimated population of Scotland in 1873 was 3,430,923. The birth and death rates differ but little from those of England, but while the birth-rate of Scotland is nearly the same as that of England, the marriage-rate in the two countries differs considerably, as will be seen by the subjoined figures :—

Persons married to 1000 persons living.

Years.		England.	Scotland.
1864	-	17·3	14·4
1865	-	17·5	14·8
1866	-	17·5	14·6
1867	-	16·5	13·8
1868	-	16·1	13·2
1869	-	15·9	13·4
1870	-	16·1	14·2
1871	-	16·7	14·2
1872	-	17·5	15·0
1873	-	17·6	15·6

This is probably owing to the difference in the marriage laws of the two countries, for marriage in Scotland can be contracted without registration.

THE ARMY.

His Royal Highness the Field Marshal Commanding-in-Chief has favoured me with returns, for the year 1873, relating to the army. The average strength of the army at home and abroad was 188,379, and the number of deaths was 2139; the rate of mortality was therefore 11·4 per 1000 of mean strength, against 13·8 in 1872.

At home, the average strength was 100,583, the deaths were 931, and the rate of mortality per 1000 of mean strength was 9·6 among officers, and 9·2 among non-commissioned officers and men, against an annual average of 9·2 and 11·4 respectively in the twelve years 1861-72.

Abroad, the average strength was 87,796, the deaths were 1208, and the rate of mortality per 1000 of mean strength was 12·1 among officers, and 13·8 among non-commissioned officers and men, against an annual average of 14·0 and 19·3 respectively, in the twelve years 1861-72. So the mortality of the army, both at home and abroad, was below the average. A striking reduction in the mortality of non-commissioned officers and men at home is observed since the year 1868 when the rate fell from 12·3 per 1000, to 11·4 in 1870, and to 9·0 in 1872.

THE NAVY.

In the Statistical Report of the Health of the Navy for the year 1873, it is stated that the total force afloat was 45,440, and that the deaths were 378, so that the rate of mortality was 8·3 per 1000 or nearly the same as in the previous year.

The number of deaths from disease was 274, and from wounds, injuries, and drowning 104. The death-rate from disease was 6·0 per 1000, and from violence 2·3 per 1000, against 5·7 and 2·5 respectively in 1872.

Out of the 274 deaths from disease 24 were referred to enteric fever, 32 to yellow fever, 16 to remittent fever, 39 to consumption, 20 to heart disease, 21 to pneumonia, 16 to dysentery, 10 to stomach disease, 8 to kidney disease, and 5 to delirium tremens. In every 100 deaths 27·5 were from wounds, injuries, or drowning.

The lowest ratio of sickness in 1873 was on the south-east coast of America ; the highest in the irregular force.

The mean force employed on the *home* station was 22,400, and the deaths were 138, being in the proportion of 6·1 per 1000.

The annexed Table shows the mortality at the different Stations during the years 1872 and 1873 :—

* Including the deaths by the loss of Her Majesty's ship Captain.
† Including the deaths by the loss of Her Majesty's ship Bombay.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—The number of returns forwarded to me by captains or commanding officers of British vessels relating to births and deaths occurring at sea among English subjects is incomplete. Particulars of only 80 of such births and 245 of such deaths were reported to me in 1873, whereas the number of births and deaths of British subjects at sea reported to the Registrar-General of Merchant Shipping and Seamen was 309 and 1201 respectively. These records will be more complete now that the Registration Act of 1874 is in operation, for by the 37th section of that Act every captain or master, or other person having charge of a ship and failing to forward the necessary particulars, is liable to a penalty not exceeding 5*l.* for each offence.

Mercantile Marine.—The number of mariners at sea, exclusive of masters, in the year 1873, as reported by the Registrar-General of Shipping and Seamen, was 202,239. The deaths were 5393, and the rate of mortality was therefore 26·6 per 1000 strength : this rate is considerably above the average (21·4) of 22 years.

The number of mariners in the merchant service, exclusive of masters, whose deaths were referred to drowning, together with the mortality by drowning in the Royal Navy in each of the years 1866-73, are shown in the annexed Table.

* Including the deaths by the loss of Her Majesty's ships "Captain" and "Slaney."

The average annual mortality by drowning in the merchant service in the seven years 1866-72 was 13·3 per 1000 strength. Two thirds of the total deaths by drowning—5·4 per 1000—were called accidental, and this excessive mortality shows great carelessness of precautionary measures on the part of the owners, the masters, or the men. The average annual rate of mortality by wreck was 8 per 1000, but even this high rate was exceeded in the year 1873, when 2231 lives were lost by wreck alone out of a strength of 202,239, representing a mortality of 1·1 per 1000.

The total loss by drowning in 1873 was 3263 or 16·1 per 1000, and includes 1032, or 5·1 per 1000, by accident.

In the 8 years 1866-73, no less than 21,748 lives were lost by drowning, 13,244 by wreck and 8504 by accident.

It is gratifying to know that much of this deplorable sacrifice of human life is likely to cease when the "Merchant Shipping Act of 1875"* comes into operation. By this Act much time will be saved in bringing about the detention of unseaworthy ships, and the owners or masters will be compelled to use all reasonable efforts to insure the seaworthiness of their ships. If a ship is hereafter sent to sea in an unseaworthy state, or is not kept in a proper condition, the representatives of seamen will have a right of action for damages, and heavy penalties are also provided against sending ships to sea to the danger of human life.

The average annual rate of mortality by drowning in the seven years 1866-72 in the Royal Navy was 2·9 per 1000 strength, thus the risk of death by drowning in the Merchant Service is more than four times as great as it is in the Royal Navy.

* See Merchant Shipping Act, 1875, 38 & 39 Vict. c. 88. To continue in force until the first day of October 1876.

WILLS.

Mr. Leslie in his annual report of Judicial Statistics for 1873, publishes a return from the Chief Registrar of the Court of Probate, showing that the number of probates and administrations granted at the Principal Registry during the year was 16,010. The value of the effects was sworn under 70,576,080*l*.

The returns furnished by the district Registrars record the number of probates and letters of administration granted in the 40 district registries during the year as 25,249. The value of the property under which these probates and administrations were sworn was 48,811,011*l*.

The results for the Principal and District Registries combined were—probates and administrations 41,259—value of effects sworn under 119,387,091*l*. The average value of each being 2894*l*. against 2864*l*. in the previous year. The proportion of the cases in which people above the age of 21 left wills, or left estates on which letters of administration were taken was 1 in 6, or 16·0 per cent.

Printed Calendars of all grants of probates and administrations from the year 1858 to the present time, showing the names and descriptions of the testators and intestates alphabetically arranged, together with other particulars, are deposited for public reference at this office.

EUROPEAN STATES.

The details relating to vital statistics in Foreign States will be found in a series of tables on pages cxxiii–cxxviii. The annexed Table shows the annual rates per 1000 of population of persons married, births, and deaths in the various States from which returns have been received.

* The mean annual rates for Spain are for the ten years 1861–70, those for Italy are for the ten years 1863–72.

In comparing the average annual results in the 20 years 1853–72 with those for the year 1873, it must be borne in mind that deaths in war contributed to raise the mortality unduly in Austria in 1866, in Prussia in 1866, 1870, and 1871, and in France in 1870 and 1871. For explanation as to any remarkable increase in the respective rates from epidemics, see notes at foot of Tables, pp. cxxiv–cxxviii.

The marriage rate was highest in Prussia and Austria, and lowest in Sweden and Italy in the year 1873. The rates in Denmark, Sweden, Austria, the Netherlands, and Italy, were not only higher in 1873 than the average, but higher than the proportions in 1872. In France the marriage rate in 1873 (17·8), although higher than the average, was considerably lower than in 1872, when it was 19·5.

The highest birth-rates were in Austria (40·3) and Prussia (39·7), this is a natural sequel to the high marriage-rates in these two States, but the States with the *lowest* marriage-rates, which were Sweden and Italy, did not afford the lowest birth-rates, for the lowest birth-rate was in France (26·2). Sweden had a *comparatively* low birth-rate, while Italy had a high birth-rate. Probably all the marriages are not at present registered in Italy.

The death-rate in 1873 in each of the European States arranged in order of mortality was:—Sweden 17·2, Denmark 19·7, England 21·1, France 23·2, the Netherlands 24·0, Prussia 28·0, Italy 30·0, and Austria 38·5. In Austria the rate greatly exceeded the average (31·9), and in Prussia the mortality slightly exceeded the average (27·2). The mortality in 1873 in the other States was below the average.

INCREASE OR DECREASE OF POPULATION.

Population increases by the excess of births over deaths, and by the excess of immigration over emigration. On the other hand, the population may *decrease* by an excess of deaths over births, and of emigration over immigration.

Acquisition or loss of territory by some of the European States has interfered with the comparison of the annual rates of increase of population in recent years.

* Inclusive of the loss of the territories of Alsace-Lorraine the annual rate of decrease per cent. in the six years 1866-72 was 0·89.

NOTE.—The above rates have been deduced from the returns of population received from the different countries. In some cases the population is estimated to the middle of the census years, *see* detailed Tables, pages cxxiv-cxxviii. These results may therefore be found to differ slightly from the annual rates of increase per cent. published in the respective census returns of the different countries.

In the five years 1856-61 the annual rate of increase per cent. of population in France was 0·74. In the five years which succeeded (1861-66) the population increased at the rate of 0·36 per cent. After allowing for diminution of population by the loss of Alsace and Lorraine, the population in the six years 1866-72, owing to an excessively low birth-rate, and to a comparatively high death-rate among children,† decreased at the annual rate of 0·16 per cent. There are on an average but 319 children born in wedlock in France to every 100 marriages, whereas in England the proportional number is 406.

The enumerated population of Austria, including Hungary, Croatia, Slavonia, and Transylvania, but excluding the Italian States, was 32,618,002 in 1857, and 35,904,435 in 1869; the increase of population being at the annual rate of 0·80 per cent. Excluding Hungary, Croatia, Slavonia, and Transylvania, as well as the States of Italy, the enumerated population of Austria was 18,224,500 in 1857, and 20,395,083 in 1869; the increase of population being at the annual rate of 0·94 per cent. These populations include the army.

† The mortality of children under 5 years of age, in Paris, in the year 1873, was 10·6 per cent. of the numbers living at that age. In London in 1873, the mortality at that age was 7·2 per cent. In the five years 1856-60 the annual rate of mortality per cent. of children under 5 years of age in France was 7·9. In 1871 (the year of the siege) it was 10·1 per cent. of population, but in 1872 it fell to 6·8 per cent. In England the rate declined from 6·8 per cent. in the ten years 1851-60, to 6·2 in 1873. The ages of the 84,713 persons whose deaths were registered in the department of the Seine in 1870 (the first year of the war) are not given in the Official Returns of France.

In Prussia the population increased in the three years 1858-61 at the rate of 1·39 per cent. ; in the five years 1861-67 the increase was at the annual rate of 1·11 per cent. ; and in the four years 1867-71 it was 0·69 per cent.

The population of Denmark increased in the five years 1850-55 at the rate of 1·28 per cent. per annum ; in the next five years 1855-60 it increased at the rate of 1·41, and in the ten years 1860-70 the annual rate of increase, decreased, and was only 1·05 per cent.

In Sweden, for the same periods as for Denmark, the annual rates of increase per cent. were 0·89, 1·17, and 0·77 respectively.

The Netherlands show an increase of population between the Censuses of 1859-69 of 0·80 per cent. per annum.

In Italy the annual rate per cent. of increase of population between the Censuses of 1861 and 1871 was 1·82.

No enumerations of the population have been taken in Spain since those of 1857 and 1860 when the annual rate of increase per cent. was 0·45.

I have the honour to be,

Sir,

Your faithful servant,

GEORGE GRAHAM,

Registrar-General.

QUARTERLY REPORTS, 1873.*

First Quarter.—January, February, March.

In the UNITED KINGDOM the marriages of 116,156 persons, the births of 284,779 children, and the deaths of 184,674 persons of both sexes, were registered in the three months ending 31st March 1873. The natural increase of population was thus 100,105.

ENGLAND.—The Returns of marriages, births, and deaths are almost all equally favourable. The marriage-rate has completely recovered from the depression of the year 1869; the births of the first ninety days of 1873 greatly exceeded, while the deaths were below the average. The people were unusually healthy, especially in the towns. The subsidence of epidemics, the abundant rain-fall, and the absence of nights of excessively low temperature, contributed, with the increased attention to hygienic measures, to this result; as, through rises of wages, their influence was not overwhelmed, though it was counteracted, by the high prices of the necessaries of life. Meat, bread, potatoes were dear, but their cost bore no proportion to the rise in the cost of coal, which was at a famine price, though the deaths by cold weather were less numerous than might have been expected.

Marriages.—The number of persons married during the first quarter of the year 1873 was 82,434, giving a rate per 1000 persons living of 14·3, or 0·5 above the average rate for the corresponding quarter of the ten years 1863–72, and higher than in the March quarter of any year since 1866. Of the eleven Registration Divisions the South-western alone exhibited a decrease from its average number of marriages for the three previous corresponding quarters. In the Northern Division the numbers exceeded the average by nearly one fifth. The counties showing the greatest excess were Huntingdonshire, Buckinghamshire, Staffordshire, Cumberland, Bedfordshire, and Durham. In thirteen counties the marriages fell short of their average numbers, the deficiency being relatively greatest in Oxfordshire, Dorsetshire, Devonshire, and Monmouthshire. In the last-mentioned county during several previous quarters the marriages had largely exceeded the average.

Births.—In the first quarter of 1873, 215,744 births were registered, giving an annual birth-rate of 37·5 per 1000, or 1·2 higher than the rate in the previous corresponding quarter, and 0·5 above the mean rate for the March quarter in the ten years 1863–72. The most remarkable increase was shown in the county of Durham, where the births exceeded the average of the three previous corresponding quarters by nearly 20 per cent. Large additions have probably been made to the population of this county during the last year through immigration consequent upon the demand for labour in the coal mines and iron works. The excess over the average was also considerable in the East Riding of Yorkshire, Cumberland, Northumberland, the Extra-Metropolitan part of Middlesex, Buckinghamshire, and Cambridgeshire, but in none of these counties was the per-centage of increase equal to half that in Durham. The births fell below the average of the three previous corresponding quarters generally throughout the South-eastern and South-western Divisions, and also in the counties of Hereford, Westmorland, Norfolk, Rutland, Leicester, Lincoln, and in North Wales. In the eighteen large towns furnishing weekly

* Reprinted from the "Quarterly Returns" of 1873.

returns the birth-rates averaged 40·0 per 1000. They ranged from 35·2 in Norwich and 35·6 in Nottingham, to 45·8 in Salford and 49·4 in Sunderland. In London the rate was 38·4. In the fifty towns ranking next in population after the eighteen largest the average birth-rate was 38·8. The lowest rates were 26·0 in Bath, 28·7 in Hastings, and 29·6 in Brighton; and the highest 49·0 in Dudley, 49·4 in Wigan, and 49·6 in Gateshead.

Increase of Population.—The excess of births over deaths amounted during the 90 days of the quarter to 83,312 or 926 per day. The number of emigrants of British origin, who sailed from ports in the United Kingdom at which Government Emigration officers are stationed, was 29,486, of whom 17,269 were of English, 2162 of Scotch, and 10,055 of Irish origin. In the previous corresponding quarter the number of British emigrants was 25,660, comprising 15,060 English, 1942 Scotch, and 8658 Irish. The proportions of English, Scotch, and Irish emigrants last quarter to the respective populations of England, Scotland, and Ireland were as follow: English 739, Scotch 630, and Irish 1881 per million persons. Of the 29,486 emigrants the United States attracted 23,131, British North America 293, the Australian Colonies 4396; the remaining 1666 went to other places.

Prices, Pauperism, and the Weather.—The average price of wheat for the three months ending 31st March was 55s. 10d. per quarter, differing by only 6d. from the average price for the March quarter of 1872, when it was 55s. 4d. During the two years (1871–2) of high prices no great fluctuations have occurred in the quarterly average prices of wheat, the highest average having been 59s. 9d. in the June quarter of 1871, and the lowest 55s. 4d., as above stated, in the March quarter of 1872. Potatoes (best Regents) reached the high average price of 207s. per ton at the Borough and Spitalfields Markets, against 100s. in the quarter ending 31st March 1872, and 87s. 6d. in the quarter ending 31st March 1871. The price of beef by the carcass at the Metropolitan Meat Market averaged 6 $\frac{3}{4}$ d. per lb., the same as in the previous quarter, and that of mutton 7 $\frac{5}{8}$ d., showing a rise of $\frac{3}{8}$ d. per lb.

The returns of pauperism, when compared with those for the previous corresponding quarter, show a slight increase in the average number of indoor paupers, and a further considerable decline in the average number of out-door paupers relieved on the last day of each week. The proportion of each class of paupers in the first quarter of each of the three years 1871–73 to 1000 of the estimated population was as follows:—

		In-door.	Out-door.
Quarter ending 31st March 1871	-	7·1	38·6
" " 1872	-	6·4	33·7
" " 1873	-	6·4	30·1

The warm period which set in on the 9th of last December continued till January 19th. From the 1st to the 19th January the mean daily excess of temperature was 10°. After a few days of average temperature a cold period began on 25th January and continued throughout February, during which the average daily deficiency was 4°. This was followed by a week of warm weather with an average daily excess of 3 $\frac{1}{2}$ °, then by a cold fortnight during which the average daily deficiency was 3 $\frac{1}{4}$ °, and the quarter closed with a week of warm weather in which the daily excess averaged 3 $\frac{1}{2}$ °. The mean temperature for the quarter was 39°·4 or 0°·8 above the average in 102 years. It was 42°·1 for January, 34°·3 for February, and 41°·9 for March. Thus the mean temperatures of January and March were nearly equal, and were respectively 7°·8 and 7°·6 above that of February. The mean temperature of January was 5°·8 above and that of February 4°·3 below the average in 102 years. The mean temperature of March differed but little from the average. A decline of

several degrees in temperature from January to February is rare. Except in 1853, the decline this year was greater than any that has occurred during a period of more than 100 years. The rain-fall in the quarter at Greenwich amounted to 5·7 inches, or 0·2 in. above the average of 58 years. There was an excess of 0·6 in. in January and of 0·3 in. in February, and a deficiency of 0·4 in. in March. The mean quantity collected during the quarter between latitudes 50° and 55° was 8·08 inches.

Deaths; and State of the Public Health.—The 132,432 deaths registered during the first three months of this year were less than the number returned in the corresponding period of any year since 1868. The mortality was at the annual rate of 23·0 per 1000 persons estimated to be living against 26·0, 24·7, and 23·5, respectively, in the first quarters of the three years 1870–1–2; the rate in the quarter was 2·2 per 1000 below the average rate in the corresponding quarter of the ten years 1863–72. The mean temperature of the quarter was 39°·4, which, although somewhat higher than the average for the same period in 102 years, was no less than 4°·1 below the unusually high mean temperature which prevailed during the first three months of 1872. January was remarkably mild, but the temperature during February was unusually low, although there was no continuance of severe frost. The influence of this cold weather upon the mortality may be judged by the death-rate recorded in the 18 large English towns, including London, which are estimated to contain a population of nearly six millions and a half of persons, and for which a weekly return is published. During the five weeks ending 1st February, when the mean temperature at the Royal Observatory, Greenwich, averaged 42°·0, or 5°·0 above the average, the annual death-rate in these 18 towns averaged 21·9 per 1000, while in the last eight weeks of the quarter, when the mean temperature was 38°·1, or 2°·1 below the average, the death-rate was 26·6 per 1000. It is probable that the death-rate in the whole of England and Wales was influenced by the cold weather of February scarcely less than in the 18 towns. The decline in the mortality of the quarter cannot be attributed to its higher temperature, but was rather due to the marked decline in the fatality of the principal zymotic diseases which will presently be considered.

In the eleven Registration Divisions the mortality ranged upwards from 18·8 in the South-eastern Division, which contains the principally rural counties of Surrey, Kent, Sussex, Hampshire, and Berkshire; in the Yorkshire, and Welsh Divisions the rate was 23·8, and in the North-western Division, including the counties of Lancashire and Cheshire, it was so high as 26·9. In Lancashire the annual death-rate was equal to 27·7 per 1000, while in Cheshire it did not exceed 22·9; the excess in the Lancashire death-rate was in great measure due to the fatality from zymotic diseases, and to the high rate of infant mortality.

The Registration Districts and sub-districts, containing all the chief towns of England and Wales, have an estimated population of nearly 13 millions and a half of persons; among this urban population the annual death-rate was 24·4 per 1000, and 3 per 1000 below the average rate in the ten previous corresponding quarters. In the remaining, or rural population, the death-rate was 21·1 per 1000, and only 1·5 below the average rate in the first quarter of the ten years 1863–72. The urban mortality was one per 1000 below that in the March quarter of 1872, while the rural rate showed a slight increase. The marked improvement in the public health, which is doubtless in progress, appears to be principally confined to the town districts, in which the fatality of zymotic diseases is decreasing. The formation of rural sanitary districts will probably enable the small villages and country parishes to exhibit before long a decline in their death-rate corresponding with the improvement in the health of the towns.

In the 18 large English towns, including London, with a population of six millions and a half, for which weekly returns are published, the average mortality was 24·8 per 1000, or but slightly above the rate in the entire urban population; the lowest rates in these towns were 18·1 in Portsmouth, 22·1 in Nottingham, and 22·7 in London; the highest rates were 29·4 in Newcastle-upon-Tyne, 30·8 in Oldham, 31·1 in Salford, and 34·1 in Manchester. The excessive rates in Newcastle and Oldham were caused by the fatality of scarlet fever, while measles and scarlet fever were prevalent in Manchester and Salford. Let us hope that the excellent sanitary intentions of these great centres of manufacturing industry will soon be realized. Every day's delay is dangerous.

Fifty other large towns are estimated to contain a population of rather more than two millions and a half, among whom the death-rate in the first quarter of the year was equal to 24·7 per 1000, which differed but slightly from the rate in the 18 largest towns, and was 0·3 per 1000 above the rate in the entire urban population. Of the 50 towns, Dover 17·6, Yarmouth 19·3, Brighton 19·5, Lincoln 19·5, and Maidstone 19·5, showed rates under 20 per 1000; while the rates exceeding 30 per 1000 were 31·5 in Exeter, 33·5 in Bury, and 35·5 in Preston. The rate from zymotic diseases was excessive in each of these three last-mentioned towns.

The 132,432 deaths in England and Wales included 30,903, or 23 per cent. of infants under one year of age; and 38,305, or 29 per cent. of persons aged 60 years and upwards. The deaths of infants under one were lower than in any of the three previous corresponding quarters, notwithstanding the large increase in the number of births since the first quarter of 1870. The deaths of infants under one were equal to 15·8 per cent. of the births registered in the first quarter of 1870, to 14·9 in the same periods of 1871 and 1872, and in the three months ending March 1873, the proportion further fell to 14 per cent. Infant mortality measured in this way averaged 14·2 in the 18 large English towns, and ranged from 10·9 in Portsmouth to 18·9 in Leicester, which town maintains its unenviable notoriety for waste of infant life; so excessive is this infant mortality in Leicester, that it seems to demand a special inquiry into its cause. In the whole county of Lancashire the deaths of infants under one year were equal to 16·7 per cent. of the births registered, which appears to suggest some intimate connection between the employment of women in factories and infant mortality. In the agricultural counties of Hereford, Wilts, and Devon, this per-centage of deaths under one year to births registered was only 9·5, 12·0, and 12·1 respectively. The deaths of persons aged 60 years and upwards showed generally last quarter a large increase upon the numbers returned in the corresponding quarters of 1871 and 1872; a result probably caused by the cold weather of February following a January of remarkably high temperature. The annual death-rate in the quarter among persons estimated to be living in England and Wales, and aged 60 years and upwards, was equal to 89 per 1000, against 92, 85, and 76 respectively, in the first quarters of the three years 1870-1-2. The proportion of deaths at 60 years and upwards to total deaths was 29 per cent. in all England, while in the 18 large English towns it was 24·6, and ranged from 16·8 and 17·3 in Oldham and Manchester, to 33·0 and 33·5 per cent. respectively in Nottingham and Norwich.

One of the most remarkable and satisfactory features in the present return is the decline in the fatality of the principal zymotic diseases. In England and Wales, of the 132,432 deaths from all causes, 1084 were referred to small-pox, 1204 to measles, 2644 to scarlet fever, 579 to diphtheria, 2935 to whooping-cough, 3402 to different forms of fever, and 1854 to diarrhoea: in all, 13,702 deaths resulted from these seven zymotic diseases against 20,091, 21,551, and 24,794 in the corresponding quarters of the three years 1870-1-2. The annual death-rate from these seven

diseases was equal to 2·4 per 1000, against 3·6, 3·8, and 4·3 in the three previous corresponding quarters. The recent small-pox epidemic somewhat impairs the value of these rates as a means for measuring the recent decline in the fatality from zymotic diseases; but excluding small-pox, the annual rate from the six other principal zymotic diseases in the first quarter of the four years 1870-3 has been successively 3·5, 3·0, 3·0, and 2·2 per 1000.

In the 18 large English towns the annual death-rate from the seven zymotic diseases averaged 2·6 per 1000, exceeding by 0·2 the rate in the whole of England and Wales; this zymotic rate was lowest 0·5, 1·8, and 1·9 in Nottingham, Bristol, and London, and ranged upwards to 5·4, 5·5, and 5·8 respectively in Salford, Manchester, and Newcastle-upon-Tyne. In 50 other large towns the death-rate from the seven zymotic diseases averaged 2·7 per 1000, and was slightly higher than in the 18 towns; it was less than 1 per 1000 in Ipswich, Cambridge, Reading, Yarmouth, and Dover, but exceeded 5 per 1000 in Exeter, Carlisle, Bury, and Wigan.

The 1084 fatal cases of small-pox returned in the first three months of this year showed a further considerable decline from the numbers returned in any quarter since September 1870, when the recent epidemic first became prevalent. The deaths from this disease showed a further decline in each of the Registration Divisions, but still numbered 282 in the West Midland Counties, 197 in Yorkshire, 117 in the Northern Counties, and 116 in the South-western Counties; 154 fatal cases were returned in Staffordshire, 143 in the West Riding of Yorkshire, 87 in Cornwall, 66 in Lancashire, 56 in Worcestershire, 50 in the East Riding of Yorkshire, 48 in Durham, and 45 in Cumberland. The disease is still more or less fatally prevalent at Oldbury, Newcastle-under-Lyme, Truro, Helston, Halesowen (Worcestershire), York, Huddersfield, Darlington, Hartlepool, Cockermouth, and Whitehaven. The deaths from small-pox in England only averaged 450 in the first three quarters of 1870; they were, therefore, more than twice as numerous during the quarter as before the outbreak of the recent epidemic; it is only necessary, however, to state that 7720 deaths from this disease were returned in the first quarter of 1872 (when the epidemic reached its climax) to show the extent of the decline in this fatality exhibited in the present return.

Fever, including typhus, enteric, or typhoid fever, and all forms of simple continued fever, caused more deaths during the quarter than any other form of zymotic disease. The 3402 deaths referred to fever were, however, considerably less than the numbers returned (among smaller populations) in the corresponding quarters of the three years 1870-1-2, when they were 4177, 4073, and 3544 respectively. These deaths were equal to an annual rate of 59 per 100,000 of the population, against 75, 73, and 62, in the three preceding corresponding quarters. In the 18 largest English towns the equivalent fever rate averaged 56, and ranged from 18 and 40 the lowest in Nottingham and London, to 87 and 145 in Bradford and Sheffield. As the fever rate was slightly lower among the six and half millions of persons living in our 18 largest towns than in the whole country, and as the fatality from fever is usually the result of over-crowding or impure air or water, it is fair to assume that so soon as the smaller towns and villages shall have the advantage of sanitary organization like that now enjoyed by most of the largest towns, the death-rate from fever and other zymotic diseases will decline. Fever was prevalent throughout the greater part of Staffordshire, especially at Longton, and in many parts of Durham county. Local outbreaks of fever appear to have also occurred in Calstock, Sherborne, Doncaster, Hetton-le-Hole (Durham), Newport (Monmouth), Pontypridd, and Ystradgynlais.

Whooping-cough is usually most fatal in the first quarter of the year; the 2935 deaths referred thereto were less by 1764 than those returned in

the same period of 1872. No less than 693 occurred in London, 405 in Lancashire, and 259 in the West Riding of Yorkshire. The disease was exceptionally fatal in St. Columb and Falmouth, and caused 72 deaths in the borough of Birmingham.

Scarlet fever was fatally epidemic during 1870, but the mortality from this disease has since steadily declined. In the first quarter of the three years 1870–1–2 the deaths from scarlet fever were 6693, 6086, and 3385, respectively; they further declined during the quarter to 2644, of which 676 occurred in Lancashire, 250 in Staffordshire, 234 in the West Riding of Yorkshire, 186 in Northumberland, and 144 in Warwickshire. Among the 18 large towns this disease was more or less fatal in Manchester, Newcastle, Oldham, and Birmingham; and outbreaks of the disease occurred in Oswestry, Darlaston, Wednesbury, Sleaford, Wirksworth (Derby), Glossop, Bollington (Cheshire), Runcorn, Bury, Poulton-le-Fylde, Blyth (Northumberland), Tregaron, and Ruabon.

The decline in the fatality of measles was almost as marked as that of the other diseases of the zymotic class. The fatal cases were but 1204, against 1922, 1476, and 3121, in the three previous corresponding quarters; 401 occurred in Lancashire, 83 in North Wales, 78 in Durham, and 61 in Leicestershire. The fatality of measles was excessive in Olney (Bucks), Glastonbury, Loughborough, Salford, Manchester, Carlisle, Festiniog, and Bangor.

The deaths referred to diphtheria differed but slightly from those in the first quarter of 1872 while those returned from diarrhœa somewhat exceeded the numbers in recent corresponding quarters. The deaths from diphtheria were proportionally numerous in Wadhurst (Sussex), Bedale (Yorkshire), and in Merthyr-Tydfil.

In the principal English public institutions, including workhouses, hospitals, and lunatic asylums, 12,863 or 9·7 per cent. of the total deaths were recorded; the proportion of these deaths in the corresponding quarter of the three years 1870–1–2 was 8·7, 9·7, and 8·9 respectively. In the 18 large towns last quarter this proportion averaged 15·3 per cent., and ranged from 7·4 in Oldham, to 17·2 and 18·4 in Wolverhampton and London. The inquest cases registered in England and Wales during the three months under notice were 7057 or 5·3 per cent. of all the deaths, against 4·7, 5·0, and 4·6 per cent. in the three previous corresponding quarters; in the 18 large towns the per-centage in the quarter averaged 7·2, and was lowest, 3·6, in Bradford, while the highest proportions were 8·5 in Manchester and 11·1 in Birmingham. These per-centages of inquest cases in our large towns suggest the idea that too few Coroner's inquiries as to causes of death are held in Bradford, unless too many are held in Birmingham. The 2195 English Registrars report that 4124 or 3·1 per cent. of the deaths from all causes resulted from different forms of violence; in the corresponding quarters of 1871 and 1872 the deaths from violence were only 3883 and 3885. In the 18 large towns the proportion of deaths from violence averaged 3·8 per cent., and while it was so low as 1·8 in Bradford, was 5·7 and 5·8 per cent. respectively in Liverpool and Birmingham.

LONDON.—The health of the population living within the Metropolitan registration area, estimated at about three and a quarter millions of persons at all ages, was remarkably satisfactory during the first three months of the year, if judged either by the death-rate from all causes, or by the fatality from the principal zymotic diseases. The annual rate of mortality did not exceed 22·7 per 1000 persons living, while in the three previous corresponding quarters it was 26·7, 26·9, and 24·0 respectively. When it is considered that this large population is living within an area of 75,362 acres, with an average density of 43 persons to an acre, the fact that the London death-rate in the quarter was lower

than the average rate for the whole of England and Wales, is important evidence of the benefit derived from the sanitary organisation under which London lives; few will doubt, moreover, that even this sanitary system is susceptible of much improvement and increased efficacy. The seven principal diseases of the zymotic class caused 1566 deaths in the quarter, which were no less than 2164 below the average number in the corresponding quarter of the ten years 1863-72, after correction for increase of population. The annual death-rate from these seven diseases in the thirteen weeks ending 29th March was only 1·9 per 1000, whereas it averaged 2·6 in the eighteen large towns, and was 2·4 in the whole of England and Wales. Whooping-cough was the only zymotic disease which was especially fatal; the deaths from scarlet fever and measles were remarkably few, and the fatal cases of small-pox were fewer than in any previous corresponding quarter since 1862. The deaths referred to different forms of fever were but 337, against 458 and 402 in the two previous corresponding quarters; the annual death-rate from fever, in the whole country was equal to 59 per 100,000 persons living, while within the Metropolitan area this fever rate was but 40. Diseases of the respiratory organs and phthisis caused 7306 deaths in London, which were 477 below the corrected average number in the corresponding period of the previous ten years; these deaths showed an annual rate of 8·7 per 1000 persons living. The unusually low temperature of February caused a large increase in the rates of mortality from all causes, but especially from diseases of the respiratory organs. The annual death-rate at all ages from these diseases during the five weeks ending 1st February was only 6·3 per 1000, while, influenced by the cold weather in February, it rose to 10·6 in the next five weeks ending 8th March. The cold weather affected the mortality from these diseases, at the different groups of ages, to a very different extent. Among children under five years of age the annual rate per 1000 rose from 12·1 in the five weeks ending 1st February, to 18·3 in the succeeding five weeks, under the influence of the February cold; among children and adults aged between 5 and 40 years, the rate only increased from 3·1 to 3·8; while between 40 and 60 it rose from 8·0 to 13·9, and at 60 years and upwards from 22·5 to 53·5 per 1000.

The detailed information in the weekly returns as to the causes of death and the ages at death in London, gives the means of studying the influence of temperature upon the mortality from various forms of disease, not only at all ages, but at each of several groups of ages. It would be important to be able to compare these London results with those for other large towns, and for some of the recently formed Rural Sanitary Districts. The limits of this Return, even if the facts were at hand, would render it impossible here to discuss these results; it may, however, be hoped that the form of returns adopted by the numerous medical officers recently appointed for both Urban and Rural Sanitary Districts will be sufficiently uniform in character to afford the means for this and other important comparisons of results. Invaluable light might thus be thrown upon the causes of the variation in death-rates, which can at present be little more than guessed at.

HEALTH OF FOREIGN CITIES.—The following facts relating to Indian and Foreign cities are derived from official returns furnished by various authorities abroad:

In Paris the deaths during the quarter numbered 11,088, and were at the annual rate of 24·4 per 1000. In Brussels the births were 1581, and the deaths 1218; the respective rates were 34·4 and 26·5. The returns from Berlin comprise 5745 deaths, including 231 from typhus fever; the death-rate from all causes was 29·9, and that from typhus fever 1·1. In Vienna 5335 deaths were recorded, implying an annual rate of 34·4 per

1000; 735 deaths, equivalent to an annual rate of 4·8, were caused by small-pox. The returns from Rome show 720 persons married, 2029 births, and 1963 deaths, the respective rates being 12·0, 33·3, and 32·2. In Florence the persons married were 768, equal to a rate of 15·9; the births 1817, equal to a rate of 37·2; and the deaths 1552, equal to a rate of 31·6. In Turin there were 958 persons married, 1635 births, and 1615 deaths; the marriage-rate was 18·2, the birth-rate 30·9, and the death-rate 30·4; 152 deaths, equal to an annual rate of 2·9, were caused by measles.

In Calcutta the deaths during the quarter ending 15th March were 3643, of which 1363 were caused by fevers and 551 by cholera. In Bombay 4448 deaths were returned in the quarter, and the annual death-rate was 27·6 per 1000; of these 4448 deaths 1500, equal to an annual rate of 9·3, were referred to remittent fever, and 389 to small-pox. In Madras during the quarter ending 14th March 3702 deaths were recorded, showing a death-rate of 37·6; 240 deaths were referred to small-pox.

In New York 7074 deaths were reported in the quarter, giving a death-rate of 30·1. The returns from Philadelphia showed 4118 deaths, and a death-rate of 22·1 per 1000.

Second Quarter.—April, May, June.

In the UNITED KINGDOM the marriages of 130,254 persons, the births of 277,364 children, and the deaths of 164,625 persons of both sexes, were registered in the three months ending 30th June 1873. The natural increase of population was thus 112,739.

ENGLAND.—The people have been prosperous, and as is usual under these circumstances, the marriages exceeded the average in the first quarter of the year. The birth-rate exceeded in the winter, and was below the average in the spring quarter. The winter and the spring were healthy. The high prices of the necessaries of life, the effects of the depreciation of gold and paper, have been met by rises in the wages of the working classes. Small-pox declined and all other zymotic diseases were at a low ebb. Fever was, of all these diseases, the most fatal.

Marriages.—In the quarter ending 30th June 1873, the number of persons married was 106,816, or at the rate of 18·3 per 1000 living. This rate was 0·8 above that in the June quarter of the previous year, and equalled the rate in the corresponding quarter of 1866; in none other of the ten years 1863–72 did the marriage-rate in the second quarter of the year exceed 17·5. A comparison of the number of marriages registered in the quarter ending 30th June with the average number in the three previous corresponding quarters, in each Registration Division and County, gives the following results. There was an increase in each Registration Division, the greatest proportionally being in the Northern and North Midland Divisions, and the least in the South-western, South-eastern, and Eastern. In the counties, the greatest increase is observed in Nottinghamshire, Durham, Staffordshire, Leicestershire, and Derbyshire; a very slight increase is seen in Suffolk, Dorsetshire, and Somersetshire; and a decrease in Wiltshire, Devonshire, Herefordshire, Shropshire, Rutland, and Westmorland. Viewing the rise or fall of the marriage-rate as a sufficiently reliable indication of the bright or gloomy prospects of the mass of the population, it may be inferred from the returns for this and several previous quarters that the prosperity which, on the whole, this country has enjoyed during the last two years has not been diffused amongst all sections of the community; but that, speaking generally, it has been experienced principally in the coal and iron-mining districts, to a less degree amongst the population engaged in the cotton and woollen manufactures, and very little, if at all, in the purely agricultural parts.

Births.—In the second quarter of 1873 ending 30th June, 206,516 births were registered, fewer by 2195 than in the second quarter of 1872. The birth-rate, 35·5 per 1000, was 0·8 below the mean rate for the ten previous June quarters, and as much lower than the rate for the corresponding quarter of 1872. In the South-eastern, South Midland, Eastern, and South-western Registration Divisions the births were below the average numbers registered in them respectively for the three previous corresponding quarters. Twenty counties showed a decline from their respective averages, the greatest falling off being in Huntingdonshire, Herefordshire, Suffolk, and Berkshire. In most of the remaining counties the increase was only slight; it was most considerable in Northumberland and Durham. In the eighteen largest English towns, including London, the birth-rates averaged 36·6 per 1000, against 37·7 in the previous corresponding quarter. In London the rate was 33·9, or 1·4 less than in the June quarter of 1872. The lowest rate last quarter in these eighteen towns was 32·4 in Norwich, and the highest 43·9 in Sunderland. In the fifty next largest towns the average birth-rate was 36·6, the same as in the eighteen towns. The variation of the rates in these fifty towns was from 23·2 in Hastings, 24·4 in Bath, and 25·4 in Chatham, to 47·5 in Gateshead, 49·0 in Dudley, and 50·0 in Wigan. The population of these last three towns may possibly have increased more rapidly than has been estimated, in which case the birth-rates would be lower than above stated.

Increase of Population.—The births during the three months exceeded the deaths by 87,934; the natural increase of population was thus at the rate of 966 per day. The emigrants of British origin, who sailed during the quarter from ports at which Government Emigration officers are stationed, numbered 103,382, of whom 45,202 were English, 10,858 Scotch, and 47,322 Irish. The numbers in the previous corresponding quarter were, English 40,423, Scotch 9168, and Irish 39,622. The proportions of English, Scotch, and Irish emigrants last quarter to a million of the respective populations of the three countries were, English 1935, Scotch 3164, Irish 8854. Of the 103,382 British emigrants 80,835 had for their destination the United States, 16,169 British North America, 5209 the Australian Colonies, and the remaining 1169 various other places.

Prices, Pauperism, and the Weather.—The average price of wheat for the three months ending 30th June was 56s. 5d. per quarter against 55s. 10d. in the previous quarter ending 31st March, and 56s. 8d. in the quarter ending 30th June 1872. The mean price for the June quarter in the ten years 1863–72 was 51s. 6d. Potatoes (best Regents) averaged 212s. 6d. per ton at the Borough and Spitalfields Markets, or 75s. 6d. more than in the corresponding three months of 1872, and nearly double the mean price (107s. 6d.) for the quarter ending 30th June in the ten years 1863–72. A further large advance took place in the price of meat, the average price of beef by the carcass at the Metropolitan Meat Market having reached 7 $\frac{3}{8}$ d., and of mutton 8 $\frac{1}{8}$ d. per lb. In the previous quarter the respective averages were 6 $\frac{3}{4}$ d. and 7 $\frac{5}{8}$ d., and the mean prices for the same period of the previous ten years were 5 $\frac{1}{8}$ d. per lb. for beef, and 6 $\frac{1}{2}$ d. for mutton. The average price per ton of seaborne coal in the London Market was 29s. 3d. against 21s. 7d. and 16s. 2d. in the corresponding quarters of 1872 and 1871 respectively.

The average number of in-door paupers relieved on the last day of each week in the quarter slightly exceeded the number in the corresponding quarter of 1872, but there was a considerable decrease in the number of out-door paupers. The proportion of each class of paupers in the second quarter of each of the three years 1871–73 to 1000 of the estimated population was as follows:—

		In-door.	Out-door.
Quarter ending 30th June 1871	-	6·2	35·4
" " 1872	-	5·8	31·4
" " 1873	-	5·8	28·5

The first five days of April were warm, with a mean daily excess of temperature of $3\frac{1}{4}^{\circ}$; then followed a cold week with an equal deficiency. From the 14th to the 21st April the weather was again warm, the average daily excess of temperature being $6^{\circ}\cdot 9$. On the 22d April a long cold period set in, and continued till the 18th June, the deficiency of temperature averaging $2\frac{3}{4}^{\circ}$ daily. The remainder of the quarter was warmer, but not uninterruptedly so, the temperature on four of the twelve days having been below the average for the season. The mean temperature for the quarter was $51\cdot 8$ or $0\cdot 5$ below the average in 102 years. The deficiency for April was $0\cdot 1$, and for May $2\cdot 0$; for June there was an excess of $0\cdot 7$. The rain-fall at Greenwich, differing but slightly from the mean quantity collected between latitudes 50° and 55° , amounted to $4\cdot 7$ inches, or one inch less than the average in 58 years. In April and May there was a deficiency, and an excess in June.

Deaths; and State of the Public Health.—The 118,582 deaths registered during the second or spring quarter of this year were 2337 below the average number returned in the corresponding period of the three years 1870–2, without any correction for increase of population, and the number was actually lower than in the second quarter of any year since 1868, when only 110,010 deaths were registered. The mortality was at the annual rate of $20\cdot 4$ per 1000 persons estimated to be living, against $21\cdot 6$, $21\cdot 3$, and $21\cdot 0$ respectively in the spring quarters of the three years 1870–1–2; the average rate in the corresponding quarter of the ten years 1863–72 was $21\cdot 8$, while in the several years of that period the rates ranged from $24\cdot 2$ in 1866 to $20\cdot 2$ in 1868. The unfavourable effect upon the public health, produced by the prolonged continuance of the usual dry cold winds incidental to an English spring, appears to have somewhat counteracted that of the unusually small fatality of the principal zymotic diseases.

In the eleven Registration Divisions the mortality of the quarter was so low as $16\cdot 4$ and $17\cdot 5$ per 1000 in the South-eastern and South Midland Divisions, which contain principally rural counties; in the other divisions the rates ranged upwards to $22\cdot 9$ in the northern counties (including the mining districts of Durham and Northumberland) and $24\cdot 1$ in the north-western counties of Lancashire and Cheshire. Compared with the average number of deaths returned in the second quarters of the last three years, the deaths registered in the quarter showed a considerable increase in Norfolk, Derbyshire, Cheshire, Lancashire, Cumberland, and North Wales; this increase occurred in spite of a considerable decline both in the whole of England and Wales and in most of the other counties, and may generally be traced to the excessive fatality of zymotic disease.

The Registration Districts and sub-districts containing all the chief towns of England and Wales have at the present time a population estimated at nearly 13 millions and a half of persons; among this urban population the annual death-rate was $21\cdot 6$ per 1000, and $1\cdot 8$ per 1000 below the average urban rate in the ten previous corresponding quarters; the nearest approach to so low an urban rate in any of those ten spring quarters was $22\cdot 0$ in 1867, while it ranged upwards to $26\cdot 4$ in 1866. In the remaining or rural population the death-rate in the quarter was $18\cdot 8$ per 1000, and $0\cdot 9$ below the average rate in the second quarters of the ten years 1863–72; only once during those ten years was the rural death-rate during the spring quarter lower than in this quarter, in 1868 it was but $17\cdot 4$. Town death-rates naturally show a larger decline, as the result of sanitary progress, than do those in rural districts; in the first place the excess in town death-rates afforded a more fruitful field for the operation of sanitary reform, and secondly, the importance of matters relating to the public health has been more slowly appreciated in agricultural than in urban neighbourhoods. The formation of rural sanitary districts is, however, now making rapid progress, and

the appointment of competent health officers to such districts would doubtless soon result in a decline in the rural death-rates more nearly corresponding with the improvement in the health of towns, which has recently been conspicuous.

In eighteen of the largest English towns, including London, for which weekly returns are published, having an estimated aggregate population of about six millions and a half, the annual mortality in the quarter averaged 22·0 per 1000, and exceeded but slightly the rate in the whole of the urban population, 21·6. The lowest rates in these eighteen towns were 16·9 in Portsmouth, 19·5 in Norwich, and 20·0 in London; the highest rates were 26·5 in Oldham, 27·0 in Newcastle-upon-Tyne, 29·0 in Manchester, and 30·4, in Salford. The average rate in these large towns differed but slightly from that which prevailed in the same period of last year; the decline in the death-rates in Portsmouth and Leicester was considerable, while in Manchester, Salford, and Newcastle the death-rates were decidedly higher. The rate from the principal zymotic diseases in Manchester and Salford was nearly double that which prevailed in the aggregate of the eighteen towns; the fatality of these diseases also showed a marked excess in Newcastle and Wolverhampton, while it was unusually low in Norwich, Nottingham, Portsmouth, and Sunderland. Both measles and scarlet fever were epidemic in Manchester, measles in Salford, and scarlet fever in Newcastle and Wolverhampton.

In fifty other large towns, estimated now to contain a population of rather more than two millions and a half, the death-rate was equal to 21·7, almost identical with the general urban rate, and 0·3 per 1000 lower than that in the eighteen larger towns. The following of these fifty towns showed rates below 17 per 1000:—Colchester 14·6, Dover 15·2, and Cardiff 16·6; the two first mentioned of these three towns enjoyed an almost complete immunity from zymotic fatality. Exeter, Wigan, Bury, Blackburn, Gateshead, and Carlisle had death-rates between 25 and 30 per 1000, while in Macclesfield the rate was so high as 30·3, in Preston 30·9, and in Ashton-under-Lyne 32·8. The excess in the death-rate of most of these towns was due to an exceptional fatality of zymotic diseases.

The 118,582 deaths in England and Wales included 27,256, or 23 per cent., of infants under one year of age, and 31,115, or 26 per cent. of persons aged 60 years and upwards. The deaths of infants under one year were equal to 13 per cent. of the births registered during the quarter, this proportion being almost identical with that which prevailed in the three preceding corresponding quarters. Infant mortality, measured in this way, averaged 14·4 in the eighteen largest towns, and ranged from 11·1 and 11·4 in Portsmouth and Norwich, to 18·2 and 19·9 respectively in Liverpool and Oldham. The excessive infant mortality in Leicester, which has been continually noticed in these reports, showed a decline during the quarter. In the manufacturing county of Lancashire the proportion of deaths under one year to births registered was 15·5 per cent. in the quarter; in Durham, containing principally a mining population, it was 15·1 per cent., while in the South-western Registration Division, which includes the agricultural counties of Wiltshire, Dorsetshire, Devonshire, Cornwall, and Somersetshire, the per-centage of infant mortality to births was only 11·0, and was so low as 9·5 in Wiltshire. One of the most noticeable features in the death returns for the quarter now under consideration was the high death-rate among persons aged 60 years and upwards, probably due to the influence of the cold winds during the spring, through an excessive fatality of bronchitis and other inflammatory diseases of the respiratory organs. According to the proportion observed in the numbers enumerated in 1871, there were living in England and Wales at the middle of this year 1,745,569 persons aged 60 years and upwards; among these elderly persons the annual rate of mortality during the quarter was equal to 72

per 1000, whereas during the spring quarter of the three years 1870-1-2 the rate among persons at these ages did not exceed 68·6, 65·7, and 66·2 per 1000 respectively. The proportion of deaths of persons aged 60 years and upwards to total deaths was 26 per cent. in the quarter in England and Wales, against 23·1 and 23·6 per cent. in the two previous corresponding quarters; in the eighteen large towns it averaged only 20·9 per cent., and ranged from 15·5 and 16·1 per cent. in Salford and Bradford, to 23·7 per cent. in Nottingham and Liverpool, and to no less than 40·2 per cent. in Norwich. In explanation of the remarkably high percentage in Norwich it is important to bear in mind that the proportions of persons living at the several groups of ages are found at each Census enumeration to differ widely in the various towns. For instance, the proportions of persons living in 1871 aged 60 years and upwards averaged 5·8 per cent. of the total population in the eighteen large English towns, and ranged from 4·7 per cent. in Sheffield, and 4·8 in Liverpool, to 7·4 and 9·7 per cent. respectively in Nottingham and Norwich. This large proportion of persons living at these ages in the last two mentioned towns would in great measure account for the large proportion which the deaths of elderly persons bear to the total deaths. If, however, the annual death-rate among persons estimated (from the proportions showed at the last Census) to be living at ages 60 years and upwards be calculated for one or two of these towns, results are produced which deserve further investigation. It has before been stated that in England and Wales the death-rate in the quarter among persons at these ages was equal to 72 per 1000, and it is found to have been but 67·2 in the South-western Division, composed principally of agricultural counties. This annual death-rate among elderly persons was 80·3 per 1000 in Norwich, 81·0 in Bradford, 94·7 in Manchester and Salford, and 120·0 in Liverpool. It is scarcely surprising to find that in Liverpool, where the death-rate until quite recently was so excessive, elderly persons are delicate and die at an excessive rate. In the eighteen large English towns the annual death-rate last quarter among persons aged 60 years and upwards averaged 78·3 per 1000, and was 62·9 in Portsmouth. It appears from an examination of the causes of death in London that the high death-rate among elderly persons was there caused by the excessive fatality of diseases of the respiratory organs, and especially of bronchitis.

The present return again shows a satisfactory decline in the fatality of the principal zymotic diseases. In England and Wales, of the 118,582 deaths from all causes, 722 were referred to small-pox, 1524 to measles, 2088 to scarlet fever, 460 to diphtheria, 2575 to whooping-cough, 2883 to fever, and 2018 to diarrhoea; in all, 12,270 deaths resulted from these seven principal zymotic diseases, against 18,120, 21,420, and 19,636 in the corresponding quarters of the three years 1870-1-2. The annual death-rate from these seven diseases, which had been equal to 3·2, 3·8, and 3·4 in the spring quarters of the three years 1870-1-2, declined to 2·1 per 1000; this decline is in some measure due to the disappearance of the small-pox epidemic which prevailed in 1871-2, but the general decline in the fatality of the other zymotic diseases, renders it possible to attribute the decrease in the deaths from this class of diseases to an improved and improving sanitary condition of the people.

In the eighteen large English towns, including London, the annual death-rates from these seven zymotic diseases averaged 2·6 per 1000, and ranged from 1·1 in Norwich to 5·6 in Salford. In the fifty other towns ranking next in size as regards population, this zymotic rate was 2·3 per 1000, and while it was less than one per 1000 in Dover, Brighton, Cambridge, Colchester, and Bath, ranged upwards in the other towns to 6·0 and 6·1 per 1000 in Walsall and Gateshead. In the whole of England and Wales exclusive of the sixty-eight large towns, the zymotic death-rate was equal to 1·8 per 1000.

More deaths in England and Wales in the quarter were referred to different forms of fever than to any other zymotic disease ; they were 2883, against 3524, 3269, and 2745 in the three preceding corresponding quarters. The annual death-rate from fever, which in the second quarters of the three years 1870-1-2 had been equal to 63, 58, and 48 per 100,000, slightly increased to 50. In the eighteen largest English towns the equivalent fever rate in the three months exactly corresponded with that in the whole of England and Wales, and ranged in the several towns from 36 per 100,000 in London and 39 in Leicester and Sunderland, to 99 and 126 respectively in Sheffield and Bradford. That the average rate from fever in our eighteen largest towns should not exceed that for the whole country, is satisfactory evidence of the improved sanitary condition of the six and a half millions of persons composing the population of those crowded town centres. A few years ago the fever rate in Liverpool was very high ; last quarter it was but 53 per 100,000, and only slightly exceeded the average rate in the whole country. In many smaller towns and villages the fatality of fever still shows the necessity for conferring, as rapidly as may be, upon the whole nation the advantages of sanitary organization similar to that now enjoyed by many of the large towns. The death-rate from fever and other zymotic diseases, will then continue to decline still more rapidly. The fatal cases of different forms of fever showed an excess last quarter at Tottenham, Longton (Staffordshire), Kingswinford (Worcestershire), North Bierley (Yorkshire), Yarm (Durham), Blaenavon and Aberystroth (Monmouthshire), and at Aberdare and Ystradgunlais in Glamorganshire.

Whooping-cough was as usual less fatal in the second than it had been in the first quarter of the year ; the 2575 fatal cases reported in the quarter were also less by 840 than had been returned in the same period of 1872. The disease, however, was somewhat fatally prevalent in London, caused 18 out of 50 deaths in Littleport sub-district of Ely, and prevailed to some extent in Essex.

The fatality of scarlet fever continues to decline ; in the second quarters of the three years 1870-1-2 the deaths from this disease were 5973, 4210, and 2206 respectively, and further declined to 2088. Among the large towns scarlet fever was somewhat fatally prevalent in Newcastle, Manchester, Birmingham, and Wolverhampton ; local outbreaks of the disease also occurred at Diss (Norfolk), Walsall, Glossop, Horwich (near Bolton), Harwood (near Blackburn), Fleetwood, Handsworth (near Sheffield), Ruabon, and in several villages in Cardiganshire. The deaths from diphtheria were also below the average, and the fatality of this disease calls for no special remarks.

The 1524 deaths referred to measles, although exceeding by 320 those returned in the preceding three months, were 834 below the average number in the three preceding corresponding quarters. More than half the fatal cases of measles in the quarter occurred in the eighteen large English towns, including 302 in London and 244 in Manchester and Salford. The fatality of the disease was also excessive at the Royal Victoria Hospital, South Stoneham ; East Budleigh (Devonshire), Lichfield, Carlisle, and Festiniog.

The waves of the recent small-pox epidemic continue to recede, and the 722 deaths from this disease were fewer than in any preceding quarter since the three months ending September 1870, when the number was 500 ; the epidemic may be said to have broken out in the last quarter of that year. The 722 deaths from small-pox in the quarter included 105 in the West Riding of Yorkshire, 82 in Staffordshire, 67 in Durham, 57 in Cumberland, 49 in Lancashire, and 46 in Warwickshire. The disease was prevalent at Kenwyn (Cornwall), West Bromwich, Tipton, Great Grimsby, Morley (near Leeds), Darlington, Hartlepool, Durham, in the Egremont sub-district of Whitehaven, and Aberdare.

In the English workhouses, hospitals, and lunatic asylums 11,244, or 9·5 per cent. of the total deaths in the quarter, were recorded. In the eighteen large towns the proportion averaged 14·9 per cent., and ranged from 6·6 and 7·1 per cent. in Oldham and Bradford, to 16·3 and 18·3 per cent. respectively in Liverpool and London. The inquest cases registered in the three months were 6246, and equal to 5·3 per cent. of all the deaths; the proportion of inquests held was slightly in excess of that in recent corresponding quarters. In the large towns the inquest cases were equal to 6·9 per cent. of the deaths, the proportion in the several towns ranging upwards from 2·7 in Bradford, to 8·0 in London and Manchester, and 9·2 in Birmingham. If it be necessary and desirable to hold inquests in Birmingham upon more than 9 per cent. of the deaths which occur, it appears open to doubt whether a sufficient number of these inquiries be held in Bradford. The 2195 English registrars report that to different forms of violence 3895, or 3·3 per cent. of the deaths in the quarter, were referred; in the eighteen large towns the proportion of deaths from violence averaged 3·8 per cent., and ranged from 1·6 in Oldham and 1·9 both in Bristol and Bradford, to 5·1 and 5·3 respectively in Birmingham and Liverpool.

HEALTH OF ENGLISH WATERING PLACES.—As in former corresponding seasons a special Table is published in the present Quarterly Return, which affords the means of ascertaining approximately the state of health recently prevailing in 47 seaside or inland watering places to which a considerable proportion of town residents resort at this time of the year for healthy relaxation. The population of the districts and sub-districts taken to represent these 47 watering places is estimated at rather more than a million persons, among whom the annual death-rate in the quarter averaged 18·0 per 1000, or 17·7 in the sea-side towns and 18·6 in the inland places. The figures show that the health of these towns was in the aggregate eminently satisfactory. Corrections have been very generally made for deaths in public institutions, which would otherwise have materially affected the value of the calculated death-rates for the purposes of comparison. It must be borne in mind that the registration sub-district is the smallest unit from which returns of births and deaths are forthcoming; in many instances therefore the smaller watering places are necessarily represented by entire sub-districts, which often contain a considerable rural area. The result of this, however, would in most instances be favourable to the watering place, as regards the rate of mortality obtained. The lowest rates appearing in the Table prevailed in Hove, Bognor, Exmouth, Lyme Regis, Ramsgate, and Dartmouth, in each of which the rate of mortality was under 14 per 1000; rates exceeding 24 per 1000 prevailed, however, in Poulton-le-Fylde sub-district (including Blackpool and Fleetwood), Southport, Aberystwith, Matlock, and Bangor. The annual death-rate in the quarter from the seven principal zymotic diseases averaged only 1·2 per 1000 in the 47 watering places, but exceeded 3 per 1000 in Herne Bay, Bangor, Fleetwood, and Matlock. Measles prevailed in Bangor, and scarlet fever in Fleetwood and Matlock.

LONDON.—The population residing within the London registration area is estimated to the middle of this year, at rather more than three and a quarter million of persons. The health of this large population, massed upon an area of 75,362 acres, with an average density of 43 persons to an acre, was very satisfactory during the first quarter of 1873; indeed, the death-rate was lower during those three months than the rate which prevailed in the whole of England and Wales. During the second quarter of this year the London death-rate was equal to 20·0 per 1000, against 23·1 and 20·7 in the corresponding period of 1871 and 1872; this death-rate was again slightly lower than the general English rate. The deaths

referred to the seven principal diseases of the zymotic class, were 1832, and were no less than 1909 below the average number in the corresponding quarter of the ten years 1863--72, after correction for increase of population. The annual death-rate from these seven diseases was equal to 2.2 per 1000 during the 13 weeks ending 28th June, whereas it averaged 2.6 per 1000 in 18 of the largest English towns, and was 2.1 in the whole of England and Wales. Whooping-cough was by far the most fatal disease in this class, the 807 deaths referred thereto showing an increase of 114 upon the number returned in the first quarter of the year; they were, however, 46 below the corrected average number referred to this disease in the corresponding quarter of the ten years 1863--72. The fatal cases of different forms of fever, which in the second quarters of the four years 1869--72 had been 542, 442, 384, and 304, further declined to 298 last quarter, which was rather less than half the corrected average number in the ten previous corresponding quarters. This decline in the fatality of fever may be referred to an improved sanitary organization, to a partially purified river, and to the greater purity of the water supplied by the metropolitan water companies. The deaths from fever in London last quarter were equal to an annual rate of 36 per 100,000 of the population, while in the other large towns it ranged upwards to 99 in Sheffield and 126 in Bradford. Only 37 deaths resulted from small-pox, while the corrected average number in the ten previous corresponding quarters was 662; the deaths from measles were 302 against an average of 563, and those from scarlet fever and diphtheria only 182 against an average of 694.

The annual death-rates from all causes in the several groups of registration districts, after distributing the 3048 deaths in institutions in proportion to population, were 19.5 in the West, 19.1 in the North, 20.5 in the Central, 20.4 in the East, and 20.4 in the South districts.

The excessive mortality among elderly persons, apparently due to the long period of low temperature and cold winds which prevailed with but trifling exceptions from 22d April to 18th June, is noticeable in London as well as in the whole country. The deaths of persons aged 60 years and upwards in London last quarter were 3711 against 3357 and 3388 in the two preceding corresponding quarters. Among those persons estimated to be living at the ages 60 and upwards the annual rate of mortality was 71.4 per 1000, and almost identical with the average rate in the whole of England; London may be considered generally favourable to the health of elderly persons, compared with other large towns, for the death-rate among persons aged 60 years and upwards was 81 in Bradford, 95 in Manchester and Salford, and 120 in Liverpool.

The deaths referred to diseases of the respiratory organs and phthisis in London, which in the second quarters of the three years 1870--1--2 had been equal to 6.5, 5.9, and 6.3 per 1000, respectively, gave a death-rate of 6.7 per 1000 in the three months ending June. The largest increase appears to have occurred in the fatal cases of bronchitis, which were 2015, against 1470 and 1674 in the two preceding corresponding quarters. A comparison between the death-rates from this class of diseases in different seasons and in various localities is very desirable, and it is hoped that the form of returns adopted by the numerous medical officers of health, now being appointed for both urban and rural sanitary districts, will afford the means for such comparison.

HEALTH OF FOREIGN CITIES.—The following facts relating to Indian and Foreign cities are derived from official returns furnished by various authorities abroad:

In Paris the deaths during the quarter were 10,555, and at the rate of 23 per 1000 annually. In Brussels 1573 births and 1144 deaths (excluding those of strangers, *i.e.* of persons not ordinarily residing within the

city) were recorded, showing rates of 34 and 25 respectively. The deaths in Berlin numbered 6699 and the annual death-rate was 33; the fatal cases of typhus fever, which had been 231 in the previous quarter, declined to 183. In Vienna 4804 persons, exclusive of strangers, died during the quarter, and the corresponding death-rate was 30; 354 deaths were referred to diarrhœa. In Rome 830 persons were married, 1533 children were born, and 1724 persons (excluding strangers) died; the respective rates were 14, 25, and 28. The returns from Florence are incomplete. Those from Turin show the number of persons married to have been 968, of births 1553, and of deaths 1524, giving rates of 18, 29, and 29 respectively. In Amsterdam 1725 deaths in the quarter gave an annual death-rate of 25 per 1000; and 640 deaths in the Hague were equal to a rate of 28.

In the thirteen weeks ending 24th June, 3906 deaths were registered in Bombay, of which 1239 were referred to remittent fever, and 349 to small-pox; the death-rate from all causes was equal to 24 per 1000. In Calcutta 2606 deaths were returned in the thirteen weeks ending 14th June, and the rate was 23. In Madras 3684 deaths, including 498 from small-pox, were recorded during the quarter ending 13th June; the death-rate from all causes was 37.

In New York 6593 deaths were registered during the quarter, of which 274 were from scarlet fever and 186 from diphtheria; the annual death-rate from all causes was 26. According to the returns from Philadelphia 3932 deaths occurred in that city, implying a death-rate of 21 per 1000.

Third Quarter.—July, August, September.

In the UNITED KINGDOM the marriages of 121,084 persons, the births of 266,655 children, and the deaths of 150,944 persons of both sexes, were registered in the three months ending 30th September 1873. The natural increase of population was thus 115,711.

ENGLAND.—The summer has been healthy: the mortality low in town and country; small-pox fatal to very few children; measles, scarlet fever, diphtheria, and whooping-cough quiescent; fever less prevalent than in previous years. Diarrhœa, while cholera was looming round our shores, wherever there was dirt, asserted its destructive prerogative, but less than in previous hot seasons of the year. The birth-rate was above the average; the natural increase of population rapid. If prices were high, so were wages.

In the quarter ending 30th September last, 99,418 persons were married, against 99,612 in the quarter ending 30th September 1872. The marriage-rate was 16·9 per 1000, showing a decline of 0·2 from that in the corresponding season of the prosperous year 1872, though it still contrasted favourably with the rates which prevailed in the previous period of depression. The numbers in the different Registration Divisions and Counties are usually compared in these Reports with the averages taken from the numbers registered in each of them during the three previous corresponding quarters. On this comparison, Leicestershire, Oxfordshire, Durham, South Wales, the extra-metropolitan portion of Middlesex, Lincolnshire, and the North Riding of Yorkshire show the greatest proportionate increase, while the only counties in which any noticeable decrease appears are Westmorland, Huntingdonshire, Shropshire, Berkshire, Norfolk, Cornwall, and Wiltshire. Compared, however, with the marriages in the third quarter of 1872, a decline is exhibited in twenty-one counties, including Cheshire, the extra-metropolitan part of Surrey, Essex, Lancashire, Warwickshire, and Monmouthshire.

Births.—In the quarter ending 30th September the births of 204,167 children were registered in England and Wales; the equivalent annual

birth-rate was 34·7 per 1000, the same as for the September quarter of 1872, and 0·5 above the mean rate for the corresponding quarter in the ten years 1863–72. In two of the eleven Registration Divisions, the South-eastern and South-western, the births fell short of the averages taken from the numbers registered in them respectively in the three previous corresponding quarters. In seventeen counties the births registered last quarter were below the averages similarly obtained, the deficiency being greatest in North Wales, Herefordshire, Buckinghamshire, Bedfordshire, Dorsetshire, and Wiltshire. The excess over the average numbers was greatest in the counties of Durham, Leicester, Monmouth, Nottingham, Stafford, and Northampton, and in South Wales. The birth-rate in the eighteen largest English towns was 36·3, or 1·7 above that for the whole of England and Wales. The lowest rates were 31·0 in Norwich and 34·3 in London, both being below the rate for the whole country: the highest were 42·0 in Sheffield, 42·1 in Sunderland, and 45·5 in Leicester. In the fifty towns ranking next in order of population, the birth-rates averaged 35·8, and ranged from 21·5, 25·3, and 26·3 in Cheltenham, Bath, and Hastings respectively, to 46·0 in Wigan, 47·7 in Merthyr Tydfil, and 51·9 in Dudley.

Increase of Population.—The excess of births over deaths during the three months ending 30th September was 89,491, or at the rate of 973 per day. Emigration was more active than in the corresponding quarter of any year since 1854, 60,093 persons of British origin having sailed during the three months from ports at which Government emigration officers are stationed. Of these 60,093 emigrants, 36,777 were English, 5743 Scotch, and 17,573 Irish; the proportions to a million of the respective populations of the three countries being, English 1575, Scotch 1674, and Irish 3288. In the previous summer quarter the English emigrants numbered 36,135, the Scotch 5309, and the Irish 15,334. The destinations of the 60,093 emigrants last quarter were as follow: of 42,453 the United States; of 9667 British North America; of 6524 the Australian Colonies; and the remaining 1449 were distributed amongst other places. There was a considerable increase in the number of those who sailed to the Australian Colonies.

Prices, Pauperism, and the Weather.—The price of wheat in the Michaelmas quarter 1873 averaged 61s. 4d. per quarter, showing an advance of nearly 5s. upon the average price in the preceding three months, and of 2s. 5d. upon that in the corresponding quarter of 1872. In the ten years 1863–72, the mean price for the September quarter was 52s. 5d. In the early part of last quarter old potatoes were so scarce that no regular quotations of prices could be given, but later the prospect of a better crop this year induced a lower range of prices than prevailed at the same season of last year. Best Regents averaged 94s. 6d. per ton at the Borough and Spitalfields Markets during August and September, against 119s. in the corresponding period of 1872. The mean price for the September quarter in the ten years 1863–72 was 106s. Meat was slightly cheaper than in the previous three months, the average prices of beef and mutton by the carcase at the Metropolitan Meat Market having been 7¼d. and 7½d. per lb. respectively last quarter, against 7¾d. and 8¼d. in the June quarter. For the third quarter of the previous ten years the average price of beef was 6d., and of mutton 6½d. per lb. The average price per ton of seaborne coal in the London Market was 30s. 1d., or 10d. higher than in the quarter ending 30th June. In the September quarter of 1872 it was 27s. 6d., and in the corresponding quarter of 1871 only 17s. per ton.

The returns of pauperism for last quarter, when compared with those for the corresponding quarter of 1872, show a slight increase in the average number of in-door paupers, and a considerable diminution in the

average number of out-door paupers relieved on the last day of each week. The proportion of each class of paupers in the third quarter of each of the three years 1871-2-3 to 1000 of the estimated population was as follows :—

		In-door.	Out-door.
Quarter ending 30th September 1871		5·8	33·8
„ „ 1872	-	5·5	29·6
„ „ 1873	-	5·5	27·1

Till the 19th July the weather was mostly cold, the mean daily temperature being $\frac{3}{4}^{\circ}$ below the average. On July 20th a sudden change took place, and for a few days the weather was fine and hot, particularly on the 21st, 22nd, and 23rd; the mean temperatures of these days were $71^{\circ}\cdot7$, $75^{\circ}\cdot2$, and $72^{\circ}\cdot3$, exceeding their averages by $10^{\circ}\cdot2$, $13^{\circ}\cdot7$, and $10^{\circ}\cdot7$ respectively. From this time till September 2nd the weather was changeable, a few days of cold and a few days of warm weather alternating; the warm days, however, were the more numerous, and upon the whole of the 45 days ending September 2nd there was an excess of temperature averaging $2\frac{1}{2}^{\circ}$. Then followed a cold fortnight, after which the weather continued for the most part cold to the end of the quarter, the deficiency of mean temperature for the last 28 days averaging rather more than 2° daily. The mean temperature for the quarter was $60^{\circ}\cdot3$, or $0^{\circ}\cdot6$ above the average in 102 years. In July the excess was $1^{\circ}\cdot8$, and in August $1^{\circ}\cdot9$; in September there was a deficiency of $1^{\circ}\cdot8$. Rain fell very frequently during the first half of July, the whole of August, and the first half of September. The rain-fall at Greenwich during the three months amounted to 7·6 inches, agreeing with the average of 58 years. In July, there was a deficiency of 0·7 inches, in August an excess of 0·8 inches and in September there was exactly the average amount. The mean amount of rain collected between latitudes 50° and 55° was 8·30 inches; it was only 6·90 inches between latitudes 52° and 53° , and 10·14 inches between latitudes 54° and 55° .

State of the Public Health; Deaths.—In the third or summer quarter of this year 114,676 deaths were registered. The annual death-rate was so low as 19·5 per 1000, and 1·9 per 1000 lower than the average rate in the corresponding quarters of the 10 years 1863-72. The death-rate last quarter was lower than in the corresponding period of any year since the remarkably cold and wet summer of 1862, when the deaths were equal to but 18 per 1000 annually of the population. Had the death-rate last quarter been equal to the average rate in the ten last summers, nearly 12,000 more persons would have died, than those whose deaths were actually recorded. A very large proportion of this decrease in the number of deaths was due to the continuance of a marked decline in the fatality of the principal zymotic diseases.

In the eleven Registration Divisions of England and Wales, the annual death-rate in the quarter ranged from 15·0 and 15·3 per 1000 in the agricultural counties of the South-western and South-eastern Divisions, to 23·2 and 23·5 in the principally manufacturing and mining counties of the North-western and Northern Divisions. Durham and Northumberland were the only counties in which the deaths registered in the quarter exceeded the average numbers returned in the three preceding corresponding quarters.

The population of the Registration Districts and sub-districts containing all the chief towns of England and Wales is now estimated at about 13 millions and a half of persons; the annual death-rate among this large urban population was equal to 22·0 per 1000 during the quarter, and was 2·1 below the average rate in the ten previous corresponding quarters. In the remaining and principally rural population of about 10 millions the death-rate did not exceed 16·0 per 1000, which was 1·7

below the same average. Compared with the average rate in recent corresponding quarters, the urban mortality again showed a larger actual decline than did the rural death-rate, although relatively considered the improvement in the health of rural districts bears similar satisfactory evidence of sanitary progress to that exhibited in the returns from our urban population.

In eighteen of the largest English towns, including London, containing an estimated population of about six millions and a half, the annual mortality in the quarter averaged 23·9 per 1000, exceeding by nearly 2 per 1000 the general urban rate. The lowest rates among these eighteen towns were 17·5 in Portsmouth and 20·3 in Norwich; the highest rate was 29·9 both in Manchester and Newcastle-upon-Tyne. Diarrhœa caused a considerable mortality in most of the large towns, and scarlet fever was somewhat fatally prevalent in Wolverhampton, Birmingham, Manchester, Leeds, and Newcastle-upon-Tyne.

In the districts and sub-districts taken as approximately representing fifty other large towns, ranking in respect of population next in size to the eighteen largest English towns, and estimated to contain a population of rather more than two millions and a half, the death-rate in the quarter was equal to 21·0 per 1000, and was 2·9 below the average rate in the eighteen largest towns. Among these fifty towns the following showed rates below 17 per 1000:—Cheltenham 13·6, Dover 15·3, Devonport 15·9, Hastings 16·1, Worcester 16·1, Bath 16·2, Chester 16·4, and Northampton 16·9; the fatality of zymotic diseases was especially low in Bath, Chester, and Cheltenham. Death-rates exceeding 27 per 1000 prevailed in the following towns:—South Shields 27·6, Blackburn 27·6, Yarmouth 27·8, Stockport 27·8, Gateshead 31·2, Preston 31·8, and Wigan 32·0; the fatality of scarlet fever contributed to the excessive rates in Blackburn, Preston, and Gateshead, while in Yarmouth, Stockport, Wigan, and South Shields the mortality from diarrhœa was exceptionally high.

The 114,676 deaths registered in the whole of England and Wales included 35,252 or 31 per cent. of infants under one year of age, and 24,524 or 21·4 per cent. of persons aged 60 years and upwards. To each 100 births registered during the quarter, 17·3 deaths of infants under one year of age were recorded, against 20·0, 19·4, and 18·2 per cent. respectively in the corresponding periods of the three years 1870–1–2. Infant mortality, measured in this way, was equal to 20·2 per cent. in the North-western Division, containing the counties of Lancashire and Cheshire; while it was only 11·0 per cent. in Wales, and in the agricultural counties of the South-western Division. In eighteen of the largest English towns, including London, this proportion of infant mortality (which is in the summer quarter of the year principally governed by the fatality of diarrhœa) averaged 24·3 per cent. upon the births registered, and ranged from 16·7 and 17·0 in Portsmouth and Oldham, to 30·6 and 34·0 in Liverpool and Leicester. Infant mortality in Leicester, although so excessive, showed a decline from the still higher proportion, 40·5 per cent., which prevailed in the corresponding period of last year. The largest portion of the decline in the deaths registered in England and Wales in the quarter occurred among those of children and adults aged between 1 and 60 years, probably due in great measure to the marked decline in the fatality of small-pox, measles, and whooping-cough. The deaths of persons aged 60 years and upwards in the quarter slightly exceeded the number returned in the corresponding period, of either of the three preceding years; and the proportion to total deaths, which had been 19·4 in the third quarter of 1870 and 1871, and 20·4 in the same period of 1872, further rose to 21·4. With a decline in infant mortality and of the deaths of children, and an increase in the proportion of deaths of persons aged 60 years and upwards, it may fairly be assumed that the

mean age at death in England and Wales was higher than it had been in recent corresponding periods.

The present return shows a continuance of the decline in deaths referred to the principal zymotic diseases which has been noticed in recent quarters. During the three months ending September, 277 were reported from small-pox, 1180 from measles, 2593 from scarlet fever, 502 from diphtheria, 1666 from whooping-cough, 3053 from different forms of fever, and 13,925 from diarrhoea; in all, 23,196 deaths resulted from these seven principal zymotic diseases, against 33,963, 31,388, and 27,428, in the corresponding quarters of the three years 1870-1-2. If the increase of population be taken into account, the annual death-rate from these seven diseases in the quarter was equal to 3·9 per 1000 of the estimated population, while in the three preceding corresponding quarters it had been 6·0, 5·5, and 4·7, respectively. A large proportion of the zymotic rate in the summer quarter of the year is always caused by the fatality of diarrhoea. In the eighteen large English towns the annual death-rate from the seven zymotic diseases averaged 6·6 per 1000, and ranged from 3·5 and 3·7 in Oldham and Bristol, to 9·4 and 11·5 in Birmingham and Leicester. In fifty other large towns the death-rate from these diseases averaged 4·5 per 1000, and while it was less than 2 per 1000 in Bath, Cheltenham, Chester, Halifax, and Newport (Monmouth), it equalled or exceeded 10 per 1000 in Dudley, Preston, and Gateshead.

During the three months ending September 13,925 deaths were referred to diarrhoea in England and Wales; in the three preceding corresponding quarters the numbers were 17,647, 15,919, and 14,681. Judging from the weekly returns received from an aggregate population of nearly six millions and a half of persons estimated now to be living in eighteen of the largest English towns, including London, the usual summer fatality of diarrhoea reached its maximum about the middle of August, and afterwards declined rapidly. The 13,925 deaths from diarrhoea during the three months were equal to an annual death-rate of 2·4 per 1000 throughout England and Wales; in the summer quarters of 1870-1-2 it was respectively 3·1, 2·8, and 2·5. In eighteen of the largest towns the diarrhoeal rate averaged 4·5 per 1000, ranging from 1·9 and 2·8 in Bristol and Portsmouth, to 6·7 and 10·4 in Salford and Leicester. Among the fifty other large towns the death-rate from diarrhoea averaged 2·9 per 1000, was less than one per 1000 in Bath, Halifax, and Merthyr Tydfil, while it was 7·9 and 8·1 respectively in South Shields and Wigan. The variations in the death-rate from diarrhoea in the several large towns is very remarkable; for instance, during the four summer quarters of 1870-1-2-3 it averaged 9·8 in Leicester and 9·6 in Wigan, whereas it was but 0·7 per 1000 in Merthyr-Tydfil. As fully 80 per cent. of the deaths from diarrhoea are of infants under two years of age, the fatality of this disease has an important influence upon infant mortality, and may be in some degree dependent upon the low constitutional stamina of the infants, but must be mainly due to the bad water supply, the defective sanitary condition of the houses, the improper food of the children, or the neglect of the mothers. Why diarrhoea is so fatal among infants at Leicester and Wigan, and why the infants at Merthyr Tydfil escape this fatality, would be a subject for inquiry at once interesting and useful. In the remainder of England and Wales, that is excluding these sixty-eight large towns, the death rate from diarrhoea last quarter was equal to but 1·3 per 1000, against 1·6 and 1·5 in the summer quarters of 1871 and 1872. The summer epidemic of infantile diarrhoea is essentially an urban epidemic, and in the agricultural counties of the South-western Registration Division the annual death-rate from diarrhoea last quarter was only equal to 0·8 per 1000, while in the manufacturing counties of Cheshire and Lancashire, making up the North-western Division, it was 3·4. According to the Census

taken in 1871, the proportion of the population living in towns with 20,000 inhabitants and upwards was only 12·8 per cent. in the South-western, and so high as 56·7 per cent. in the North-western Divisions. It may fairly be expected that the improved sanitary organization which is being steadily, though slowly, developed, will before long exercise an important influence upon the present unsatisfactory condition of our infant population living in large towns.

To simple cholera and choleraic diarrhœa 494 deaths in England and Wales were referred in the quarter, against 527 and 471 in the two preceding corresponding quarters; they therefore differed but slightly from the numbers in recent summers. These 494 deaths included 144 in London, and 100 in the North-western Division, and bore generally a relative proportion to the deaths from diarrhœa. In some cases, however, it is exceedingly probable that severe cases of simple diarrhœa are sometimes returned as choleraic diarrhœa or English cholera; in connection with this suggestion it is worthy of note that in the registrar's sub-district of Carlton near Nottingham, not a single death was referred to diarrhœa, whereas of 25 deaths from all causes five of infants under two years were ascribed to cholera, the cause of death in each case being certified by the same medical practitioner.

Next to diarrhœa, different forms of fever caused more deaths in the quarter than any other zymotic disease. The deaths referred to fever were 3053, against 4635, 3362, and 3195 in the three preceding corresponding quarters, showing a continuous decline, which bears evidence of improved sanitary conditions. The annual death-rate from fever was equal to 0·52 per 1000, but was 0·97 in the county of Durham, the fatal cases being relatively most excessive in Stockton, Hartlepool, Bishop Auckland, and Durham. An examination of the returns in detail shows that fever, principally of a typhoid form, was fatally prevalent in many small towns and villages, among which may be mentioned Sherborne, Saltash, Kenwyn (Truro), Atherstone, Gomersal, and Blaenavon.

The returns bear evidence of an increasing fatality of scarlet fever. The deaths from this disease, which in the third quarters of 1870-1-2 had been 7498, 3488, and 2423 respectively, rose to 2593, and exceeded the number in the preceding three months by 505. Of these deaths from scarlet fever 828 occurred in the eighteen large English towns, including 158 in London, 161 in Birmingham, 133 in Leeds, 114 in Manchester, 69 in Newcastle, and 48 in Wolverhampton; they were also excessive in Dudley, Blackburn, Preston, Gateshead, Chester-le-Street, Runcorn, Audenshaw, Deeping, Leyland, Golcar, South Creake, Combmartin, Yeovil, Ruabon, Ystradyfodwg, and Portmadoc. The fatal cases of diphtheria were 502, against 474 and 406 in the two preceding corresponding quarters; this disease was especially fatal at Baschurch (Salop) and at Penarth, near Cardiff.

Whooping-cough, which caused 1666 deaths, was less fatal than in any quarter since the beginning of 1870; 584 occurred in London, where the disease was relatively more prevalent than in any of the other registration divisions. The deaths from measles, which in the third quarters of the three years 1870-1-2 had been 1390, 1688, and 1267, did not exceed 1180 in that of 1873; these 1180 deaths included 664 in the eighteen large towns, of which 353 occurred in London, 96 in Sheffield, 75 in Liverpool, and 47 in Manchester. Measles was more or less fatally epidemic in Leek, Festiniog, and Combmartin in North Devon.

Small-pox as an epidemic, which was so fatal during the whole of 1871, and the greater part of 1872, declined during 1873. This epidemic reached its climax in the first quarter of 1872, when 7720 fatal cases were registered; the quarterly numbers afterwards steadily and rapidly declined, and only 277 deaths were referred to the disease in the third quarter of 1873, which is probably the smallest number that occurred in any

quarter since the beginning of the present century. Only one death from small-pox occurred in the eight counties forming the South-midland Division, and only 15 among the population of three millions and a quarter of persons living within the Metropolitan area. The disease was, however, somewhat prevalent at Gloucester, Birmingham, Bolton, Bradford, Dewsbury, Stockton, Hartlepool, Whitehaven, and Pontypridd.

An examination in detail of the present return, as usual, discloses many instances of excessive death-rates and fatality from zymotic diseases, in small villages and rural sub-districts, but the numbers being small, and the localities not widely known, the cases are apt to escape general attention. The registration sub-district of Combmartin in North Devon is a case in point; it has an almost stationary population of about 3600 persons, among whom 33 deaths were registered last quarter, whereas the average number in the corresponding quarter of the three previous years is but 13. These 33 deaths included 10 fatal cases of scarlet fever and 8 of measles, all of which occurred within the parish of Combmartin, which has a population of only 1400 persons; this would be equal to an annual death-rate of more than 50 per 1000 from these two diseases alone, whereas the annual rate from these diseases in the whole of England and Wales in the quarter did not average one per 1000.

In the workhouses, hospitals, and lunatic asylums 9244 deaths were recorded in the quarter, or 8 per cent. of the total deaths; in the corresponding quarter of last year the proportion was 7·8 per cent. Half of these institution deaths were recorded in the eighteen large English towns, among which the proportion to total deaths averaged 11·9 per cent., and ranged from 6·5 in Sheffield, to 12·3, 13·5, and 15·1 per cent. respectively in Liverpool, Bristol, and London. During the three months 6046, or 5·3 per cent., of the deaths were registered upon the information of the coroner, being inquest cases. In the eighteen large towns the inquests were equal to 5·7 per cent. of the deaths, and in the several towns the proportion ranged from 2·3 per cent. in Sunderland to 7·4 and 7·8 respectively in Portsmouth and Birmingham. In considering these proportions it appears difficult to avoid one of two conclusions: either too few inquests are held in Sunderland, or an unnecessary number of such inquiries take place in Portsmouth and Birmingham.

LONDON.—The health of the population residing within the Metropolitan registration area, estimated at rather more than three and a quarter millions of persons, was comparatively satisfactory during the quarter; the annual death-rate during that period was equal to 21·8 per 1000, against 23·4, 22·9, and 21·4, respectively, in the three preceding corresponding quarters, and was 4·3 per 1000 lower than the average rate in the seventeen next largest English towns, with an aggregate population about equal to that of London. The deaths referred to the seven principal diseases of the zymotic class were 4731, of which 3170 were fatal cases of diarrhoea, 584 of whooping-cough, 375 of fever, 353 of measles, 158 of scarlet fever, 76 of diphtheria, and only 15 of small-pox. These 4731 deaths were equal to an annual rate of 5·7 per 1000, whereas in the seventeen other largest towns this zymotic rate was 7·6 per 1000. Compared with the numbers of deaths returned from these seven zymotic diseases in the two previous corresponding quarters, the fatal cases of whooping-cough, fever, measles, and diarrhoea showed an increase, while those of small-pox and scarlet fever had declined. The most unsatisfactory feature is the increase in the deaths from different forms of fever: the deaths from this cause, which in the three preceding corresponding quarters had successively been 545, 355, and 316, rose again last quarter to 375, including 56 cases of typhus, 240 of typhoid or enteric fever, and 79 of simple continued fever. The annual death-rate from fever in the whole of England and Wales last quarter averaged 52 per 100,000 of the population, and in London it was 45. The 15 deaths from small-pox was

by far the lowest number returned from this disease in any quarter of any year since the beginning of 1840; it is worthy of note that 9 of these deaths from small-pox occurred in East London, which usually suffers most severely from the disease when it is epidemic. Diseases of the respiratory organs and phthisis caused 3902 deaths in London, against 3830 in the third quarter of last year; the annual rate of mortality from these diseases was equal to 4.7 per 1000, while the rate from the same diseases was 5.8 in Liverpool and 4.8 in Birmingham. The influence of temperature and other meteorological features upon the mortality of persons at different ages from the various forms of disease in London can be investigated in detail from the information published in the Weekly Returns. This will acquire greater value when similar information is rendered available by the publication of returns from the medical officers of health who have recently been appointed for numerous urban and rural sanitary districts. It is of the first importance that these returns should be sufficiently uniform to render useful comparison possible.

The violent deaths in London in the three months were 671, against 588, 635, and 664 in the three preceding corresponding quarters; 550 were referred to different forms of accident and negligence, 72 to suicide, and 35 to murder and manslaughter, including infanticide. The deaths of 64 persons directly resulted from accidents caused by horses or vehicles in the streets, from which class of accident 860 cases of injury and maiming came under the notice of the Police within the London registration area, during the thirteen weeks ending 28th September.

HEALTH OF FOREIGN CITIES.—The following facts relating to Indian or Foreign Cities are derived from official returns furnished by various authorities abroad:

In Paris 10,589 deaths were recorded in the quarter, giving an annual death-rate of 23.0 per 1000: during the last three weeks of the quarter 320 deaths were caused by cholera. In Brussels the births were 1510 and the deaths (excluding those of strangers, *i.e.* of persons not ordinarily resident within the city) 1190, the respective rates being 32.8 and 25.8. The 8627 deaths from all causes in Berlin, implying an annual death-rate of 41.8 per 1000, included 535 deaths, or 2.6 per 1000, from cholera. In Vienna the deaths (excluding those of strangers) numbered 7004 and included 2533 from cholera: the death-rate from all causes was 43.6 and from cholera 15.8. In Rome the number of persons married was 644, or at the rate of 10.6 per 1000; the number of births 1757, or at the rate of 28.8; and the number of deaths 1827, or at the rate of 30.0. In Florence there were 550 persons married, 1672 births, and 1270 deaths, giving rates of 13.2, 40.2, and 30.5 respectively. In Turin the persons married numbered 602, the births 1624, and the deaths 1276; the corresponding annual rates were 11.4, 30.7, and 24.1 per 1000. The 1604 deaths in Amsterdam implied an annual rate of 23.2, and the 602 deaths in the Hague to a rate of 26.0 per 1000. Returns received from Copenhagen show the total number of deaths in that city to have been 1286, and the equivalent annual rate 25.8.

In the thirteen weeks ending 30th September, 3671 deaths were registered in Bombay, giving a death-rate of 22.8. In Calcutta 2446 deaths, implying a rate of 21.9 annually, were returned in the thirteen weeks ending 13th September. The 3485 deaths in Madras recorded during the quarter ending 12th September showed a death-rate of 35.2, and included 635 from different forms of fever.

The returns from New York state the deaths during the quarter to have been 8954, of which 3028 were caused by diarrhoea; the annual death-rate from all causes was 35.9, of which 12.2 was due to fatal cases of diarrhoeal diseases, against a rate of 4.0 per 1000 from the same diseases in London. The 4436 deaths returned in Philadelphia were equal to a rate of 23.7 per 1000 annually.

Fourth Quarter.—October, November, December.

In the UNITED KINGDOM the marriages of 148,656 persons, the births of 265,095 children, and the deaths of 166,671 persons of both sexes, were registered in the three months ending 31st December 1873. The natural increase of population was thus 98,424.

ENGLAND.—The births in the autumn quarter that ended the year 1873, though fewer in proportion than in the previous autumn, were above the average of the season. The public health was in a favourable state, and the mortality was below the average both in town and country. The extremely severe cold week of December was accompanied by a remarkable continuance of dense fog in London, which, fatal to many, deprived it of its usual superiority over the other great cities of the kingdom. The chief zymotic diseases have been comparatively quiescent, but the public health requires watchful care, for measles, scarlet fever, and diphtheria are on the increase, and may devastate unguarded cities. The ruling prices of wheat, meat, and coals remain high.

Marriages.—The marriages in the fourth quarter of the year 1873 were more numerous than in any preceding quarter. They gradually increased from 51,393 in the corresponding quarter of 1868 to 61,281 in the three last months of 1873. The marriage-rate, which was 20·8 to 1000 persons living, or 0·8 above the mean rate for the autumn quarter in the ten years 1864–73, has never been exceeded since the autumn quarter of 1865, when it was 21·4. Compared with the average numbers for the corresponding quarter in the three previous years, the marriages in the manufacturing and mining counties of Stafford, Lancaster, and Durham, in the West Riding of York, and in South Wales showed an increase, while in the agricultural counties of Cambridge, Devon, Hereford, and Westmorland the marriages declined. The cause will be referred to under the head of prices.

Births.—The number of births registered in the quarter ending 31st December 1873 was 203,351, or 3,268 less than in the corresponding quarter of the previous year. Allowing for increase of population, the birth-rate per 1000 persons living was 34·5, or 0·9 lower than in the quarter ending 31st December 1872, but 0·3 above the mean rate for the fourth quarter in the ten years 1863–72. A comparison of the number of births registered in the quarter, with the average in the three previous corresponding quarters, for each Registration Division and County, shows that the births fell short of the respective averages in fourteen counties, the greatest proportionate deficiency being in the small counties of Huntingdon and Westmorland, and in Shropshire, Dorsetshire, and Bedfordshire. London exhibited the largest proportionate excess; then the counties of Durham, Leicester, the extra-metropolitan part of Middlesex, Monmouth, and Northumberland.

The normal birth-rates vary considerably in different parts of the country. Thus, in the year 1871 the rate in Durham was 42·4, and in Somersetshire 30·9 per 1000, and the mean rates in the ten years 1861–70 for these two counties had been 42·0 and 30·7 respectively. The principal immediate cause of this wide difference would naturally be looked for in the proportions of married women at the child-bearing ages to the total population. Accordingly it is found from the Census of 1871, that in that year in the county of Durham, with an enumerated population of 742,205, the number of females between the ages of 15 and 45 was 156,713, of whom 93,873, or about 60 per cent., were married; while in Somersetshire, with an enumerated population of 482,652, the number of females between the above-mentioned ages was 107,390, of whom 48,357, or only about 45 per cent., were married. The proportion of married women between 15 and 45 years of age to the total population was thus in

Durham 13 per cent., and in Somersetshire 10 per cent. It should be remarked that the number of males to 100 females enumerated was in Durham 107 and in Somersetshire 90. The greater prevalence of early marriages in Durham is shown by the fact that 18,099, or 5 per cent., of the total females in that county, and 6434, or only $2\frac{1}{2}$ per cent., of the total females in Somersetshire, were wives under 25 years of age.

In the eighteen most populous English towns the birth-rates in the quarter averaged 37·0 per 1000, exceeding the rate for the whole of England and Wales by 2·1, and ranged from 32·5 in Portsmouth and 32·9 in Norwich, to 42·9 in Sheffield and 45·2 in Leicester. The average rate in the fifty next largest towns was 35·5, or 1·5 below that in the eighteen largest; of the rates in these fifty towns the lowest were 23·0 in Cheltenham, 25·8 in Plymouth, and 26·3 in Shrewsbury, and the highest were 43·0 in Wigan, 44·1 in South Shields, and 48·6 in Dudley.

Increase of Population.—The births during the quarter ending 31st December exceeded the deaths by 76,521. During the same period 33,172 emigrants of British origin sailed from ports at which emigration officers are stationed, against 37,855 in the last quarter of 1872. Of these 33,172 emigrants, 21,621 were English, 2801 Scotch, and 8750 Irish; the proportions to a million of the respective populations of the three countries being English 926, Scotch 816, and Irish 1637. The destination of 20,042 was the United States; of 2289 British North America; of 9035 the Australian Colonies; and the remaining 1806 were bound for other places. A continued increase is observed in the number of emigrants attracted to the Australian Colonies.

Prices, Pauperism, and the Weather.—The average price of wheat for the quarter ending Christmas 1873 was 61s. 1d. per quarter, differing very slightly from that in the previous quarter ending Michaelmas, but showing an increase of 3s. 10d. upon the average price for the Christmas quarter of 1872, and of 10s. upon the mean price for the corresponding three months in the ten years 1863–72. Potatoes were much cheaper than at the corresponding season of the previous year, best Regents averaging 107s. per ton at the Borough and Spitalfields markets in the quarter, against 170s. in the December quarter of 1872. The mean price for the fourth quarter in the ten years 1863–72 was 99s. 6d. per ton. A further slight reduction is to be noticed in the price of meat, the average prices per lb. of beef and mutton by the carcass at the Metropolitan Meat Market, having declined from $7\frac{1}{4}$ d. and $7\frac{7}{8}$ d. respectively in the September quarter to $6\frac{3}{4}$ d. and $7\frac{1}{8}$ d. In the quarter ending 31st December 1872 beef averaged $6\frac{3}{4}$ d., the same as in this quarter, and mutton $7\frac{1}{4}$ d. per lb.; for the corresponding quarter in the ten years 1863–72 the mean prices were $5\frac{7}{8}$ d. and $6\frac{5}{8}$ d. per lb. respectively. Seaborne coal averaged 30s. 8d. per ton in the London market; it was slightly dearer than in the previous quarter, when the average price was 30s. 1d. per ton. In the corresponding periods of 1872 and 1871 the average prices were 26s. 5d. and 19s. 9d. respectively.

The returns of pauperism, compared with those for the corresponding quarter of 1872, show a slight decline in the number both of in-door and out-door paupers.

In the first week of October there was an excess of mean temperature averaging $3\frac{1}{4}^{\circ}$ daily; then followed two cold and two warm days, after which there was a cold period of more than a month's duration, in which the average daily deficiency of mean temperature was $3\frac{1}{2}^{\circ}$. From 17th November to 7th December the weather was again mostly warm. A week of very severe cold weather ensued, the deficiency of temperature on the 9th, 10th, and 11th December being $11\frac{1}{2}^{\circ}$, $16\frac{1}{2}^{\circ}$, and $12\frac{1}{2}^{\circ}$ respectively, and these days in London were distinguished by a most remarkable continuance of very dense fog. A warm period then set in, and continued

with slight exception to the end of the year; on the 16th, 17th, and 18th the daily temperatures were $10^{\circ}\cdot8$, $10^{\circ}\cdot0$, and $10^{\circ}\cdot6$ above their respective averages, and the mean temperature of these three days was 24° higher than that of the 9th, 10th, and 11th. The mean temperature of the quarter was $0^{\circ}\cdot5$ above the average in 102 years. The rain-fall at Greenwich during the quarter amounted to 5·5 inches, or 1·6 inches less than the average in 58 years. The deficiency in the month of December was 1·7 inches, the total fall in that month having been only 0·3 of an inch, and less than in any December since 1829. Between latitudes 50° and 55° the mean amount of rain collected during the quarter was 6·82 inches, or but little more than half the amount which fell in the three months ending 31st December 1872.

State of the Public Health; Deaths.—In the last three months of 1873 there were 126,830 deaths registered. The annual death-rate was equal to 21·5 per 1000, and 0·7 lower than the average rate in the corresponding quarters of the ten years 1863–72; in those ten years the only lower rates were 20·2 in the last quarter of 1872 and 21·3 in 1867, whereas in the other years the rate ranged upwards to 23·4 and 23·5 in 1871 and 1864 respectively.

In the eleven Registration Divisions of England and Wales the annual death-rate in the quarter ranged from 16·3 and 17·7 in the agricultural counties of the South-eastern and Eastern Divisions, to 25·1 in the principally mining population of the Northern Division, and 25·4 in London. The deaths in Northumberland exceeded by 22·5 per cent. the average number in the three preceding corresponding quarters, and were equal to an annual rate of 27·1 per 1000; the rate of mortality was most excessive in Newcastle-upon-Tyne, Tynemouth, Hexham, and Alnwick.

In the population of the Registration Districts and sub-districts, containing the chief towns of England and Wales, estimated at about thirteen millions and a half of persons, the annual death-rate in the quarter was equal to 24·7 per 1000, and was 0·1 below the average rate in the ten previous corresponding quarters. In the remaining and principally rural population of about ten millions the death-rate did not exceed 17·9 per 1000, and was 0·8 below the same average. In the urban districts, the average density of the population in 1871 was 4 persons to an acre, while in the rural districts there were nearly 4 acres to each person.

In eighteen of the largest English towns, including London, containing a population estimated at about six millions and a half, the annual mortality in the quarter averaged 25·5 per 1000, and exceeded by nearly one per 1000 the general urban rate. The death-rates in the several towns ranged from 20·4 and 20·5 in Norwich and Portsmouth, to 30·8 and 33·4 in Leeds and Newcastle-upon-Tyne; the excessive rates in the two latter towns were principally due to the fatal prevalence therein of scarlet fever.

In the districts and sub-districts taken as approximately representing fifty other large towns, ranking in respect of population next in size to the eighteen largest English towns, and estimated to contain a population of rather more than two millions and a half, the death-rate in the quarter averaged 23·7 per 1000, and was 1·8 below the average rate in the eighteen largest towns. The towns showing death-rates below 17 per 1000 were:—Dover 13·9, Maidstone 15·9, Cheltenham 16·2, Hastings 16·2, and Gosport 16·5. Death-rates exceeding 30 per 1000 prevailed in the following towns:—Lincoln 30·3, Dudley 30·4, Gateshead 32·8, Merthyr Tydfil 34·4, Blackburn 35·5, and Preston 42·2. The excessive mortality in these towns was almost entirely due to the prevalence of scarlet fever in an epidemic form.

The 126,830 deaths in England and Wales included 30,400, or 24 per cent., of infants under one year of age, and 32,280, or 25 per cent., of persons aged 60 years and upwards. To each 100 births registered during

the quarter 14·8 deaths of infants under one year of age were recorded against 15·7 and 13·7 per cent. respectively in the corresponding quarters of 1871 and 1872. Infant mortality measured in this way was equal to 16·6 per cent. in the Northern counties, containing principally a mining population, whereas it did not exceed 10·7 per cent. in the agricultural counties of the South-eastern Division. In eighteen of the largest English towns, including London, this proportion of infant mortality to births registered averaged 16·7 per cent., and ranged from 11·8 in Norwich to 18·6 in Liverpool and Newcastle-upon-Tyne, 19·8 in Wolverhampton, and 23·0 in Bradford. The proportion of deaths of elderly persons in England and Wales was slightly lower than that which prevailed in the same period of last year, whereas it was considerably higher than in the last three months either of 1870 or 1871. The per-centage to total deaths of those at 60 years of age and upwards averaged 20·7 in the eighteen towns, and ranged from 14·1 in Leeds to 37·2 per cent. in Norwich; in Leeds the fatality of zymotic diseases, especially of scarlet fever, caused an excessive proportion of deaths between one and 60 years, and the comparative immunity from zymotic disease which prevailed in Norwich had the opposite result in that city.

The return for the last three months of 1873 shows a somewhat general increase in the prevalence and fatality of zymotic disease. The registrars report that during the quarter 249 deaths were referred to small-pox, 3233 to measles, 5576 to scarlet fever, 719 to diphtheria, 1863 to whooping-cough, 3810 to different forms of fever, and 3439 to diarrhoea; in all, 18,889 deaths resulted from these seven principal zymotic diseases, against 26,997 and 16,794 in the corresponding quarters of 1871 and 1872. The annual death-rate from these seven diseases last quarter was equal to 3·2 per 1000, while in the last quarters of the three years 1870-1-2 it had been 4·6, 4·7, and 2·9 respectively. In the eighteen large English towns this annual zymotic-rate averaged 4·0 per 1000, and ranged from 1·5 and 2·4 in Norwich and Hull, to 7·9 and 8·8 in Leeds and Newcastle-upon-Tyne. In fifty other large English and Welsh towns the death-rate from these diseases averaged 4·3 per 1000, and while it was less than one per 1000 in Cheltenham and Rochester, it ranged upwards in the other towns to 11·8 in Gateshead, 15·1 in Preston, and 15·4 in Blackburn. Scarlet fever was fatally prevalent in each of these three towns, measles also being epidemic in Blackburn.

The recent epidemic of small-pox reached its climax in the first quarter of 1872, when 7720 deaths resulted therefrom, after which the quarterly numbers rapidly and steadily declined to 249 in the three months ending September 1873, the smallest number referred to this disease in any quarter in recent years. The 249 included 99 in eighteen of the largest English towns, of which 40 occurred in Leeds, 38 in Birmingham, and 17 in London; 29 also occurred in Gloucester, 10 in Dewsbury, 26 in Whitehaven, and 13 in Pontypridd Districts. Only 3 deaths were referred to small-pox in the South-eastern, South-midland, and Eastern Registration Divisions, containing a population of about five millions.

Measles caused 3233 deaths in England and Wales in the quarter, against 1180 in the preceding three months; in the fourth quarters of 1871 and 1872 the numbers were 3763 and 1341 respectively. Of the 3233 in the quarter, 1851 occurred in the eighteen large English towns, including 1420 in London, 104 in Liverpool, 94 in Birmingham, and 64 in Bristol. Measles also showed an exceptional fatality in Wilton, Tamar, Bideford, Bath, Foleshill, Warrington, Middleton (near Oldham), and Blackburn.

Scarlet fever showed a largely increased fatality, causing 5576 deaths, against 2088 and 2593 in the two preceding quarters of the year. In the eighteen large English towns 1724 deaths were referred to this disease, including 365 in Leeds, 283 in London, 227 in Birmingham, 228 in Manchester and Salford, 222 in Newcastle-upon-Tyne, 145 in Liverpool, and

132 in Sheffield. The deaths from scarlet fever showed a considerable increase upon the numbers returned in the preceding quarter in each of the Registration Divisions; this increase was proportionally largest in Durham, Northumberland, the West Riding of Yorkshire, and Lancashire. Among those places in which the mortality from this disease was most excessive in the quarter may be specified:—Langport, Dudley, Lincoln, Market Rasen, St. Helen's, Blackburn, Preston, the village of Rothwell, Barnsley, Gateshead, Carmarthen, Ruabon, Llanrwst, and Tremadoc. Diphtheria as well as scarlet fever showed an increased fatality; the fatal cases were 719, against 460 and 502 in the two previous quarters.

Compared with the numbers in recent corresponding quarters, the deaths referred to whooping-cough were below the average during the last quarter of 1873, being 1863, against 2966 and 2182 in the last three months of 1871 and 1872. In the eighteen large towns whooping-cough caused 907 deaths in the quarter, of which 605 occurred in London. The disease was also fatally prevalent in Kettering and Biggleswade.

Different forms of fever caused 3810 deaths in the quarter, against 4692 and 4023 in the two preceding corresponding quarters. This decline in the fatal prevalence of fever may be taken as evidence of sanitary progress. Fever invariably causes the greatest mortality in town populations, and was most excessive during this quarter in the manufacturing and mining population of Lancashire, the West Riding of Yorkshire, and Durham. Cambridge, Barrow-in-Furness, Market Weighton, Kirk Leatham, Durham, and Workington, among other places, suffered more or less severely from local outbreaks of fever.

The 3439 deaths from diarrhœa, the largest proportion of which occurred during October, differed but slightly from the numbers in recent corresponding quarters.

In the workhouses, hospitals, and lunatic asylums 11,020 deaths were recorded in the quarter, or 8·6 per cent. of the total deaths, corresponding with the proportion which prevailed in the fourth quarters of each of the two previous years. More than half these institution-deaths occurred in the eighteen large towns, among which the proportion to total deaths averaged 13·5 per cent., and ranged from 6·8 and 7·1 in Bradford and Sunderland, to 14·5 and 16·2 in Manchester and London. During the three months 6751 deaths, or 5·3 per cent., were registered upon the information of the coroner, being inquest cases; in the two previous corresponding quarters the inquest cases were 6423 and 6500. In the eighteen large towns the per-centage of inquest cases in the quarter averaged 6·5 per cent., and ranged from 3·5 and 3·7 in Bradford and Hull, to 8·6 and 8·8 per cent. respectively in Birmingham and Salford. To different forms of violence no less than 4233 deaths were referred in England and Wales, of which 1616 occurred in eighteen of the largest English towns; in these towns the proportion of deaths from violence to total deaths ranged from 2·2 per cent. in Bradford, to 6·4 per cent. in Liverpool.

LONDON.—The fatal prevalence of measles and the week of severe cold accompanied by dense fog in the early part of December unfavourably affected the health of the metropolitan population during the last three months of 1873; the annual rate of mortality during the 14 weeks ending 3rd January 1874 was equal to 25·3 per 1000, against 24·1, 25·8, and 19·8 in the corresponding periods of 1870–1–2. The London rate was, however, slightly below the average rate in 17 other large English towns having an aggregate population nearly equal to that of London. The deaths referred to the seven principal diseases of the zymotic class were 3256, of which measles caused 1420, whooping-cough 605, fever 539, diarrhœa 302, scarlet fever 283, diphtheria 90, and small-pox 17. These 3256 deaths were equal to an annual rate of 3·6 per 1000, whereas in the 17 other large towns this zymotic rate was 4·4 per 1000; but for the fatal

prevalence of measles this comparison would have been still more favourable to London. The fatal cases of measles in the Registration Division of London, which had been 120, 302, and 353 in the first three quarters of the year, further rose to 1420 during the last 14 weeks; the weekly numbers rose steadily from 32 in the 40th to 168 in the 51st week, and throughout November and December the disease was more fatally prevalent than it has been in London at any time since 1840. The 539 deaths referred to different forms of fever showed a further considerable increase upon the numbers returned in the two previous quarters; in the last quarters of 1871 and 1872 the deaths from fever were 548 and 318. The fatal cases of scarlet fever and diphtheria also showed an increase in the quarter, whereas those of whooping-cough and small-pox differed but slightly from the numbers in the third quarter of the year.

Diseases of the respiratory organs and phthisis caused 8623 deaths in London, against 5621 in the corresponding quarter of 1872; the annual rate of mortality from these diseases was equal to 9·6 per 1000, while the rate from the same diseases was 8·0 in Liverpool, and 6·8 in Birmingham. The weekly number of deaths from these diseases in London averaged rather less than 400 in the first three weeks of the quarter, whereas they rose to 1112 in the twelfth week, under the influence of the week of low temperature and fog in the early part of December.

In the public institutions of the Metropolis 3691 deaths were recorded in the quarter, equal to 16·2 per cent. of the total deaths; of these, 2109, or 9·3 per cent., occurred in Workhouses, and 1457, or 6·4 per cent., in Hospitals. A considerable proportion of the deaths in the Metropolitan Hospitals occur among patients admitted to those institutions from districts situated outside the registration boundaries of London; these deaths, however, are probably more than balanced by those of domestic servants and others, who, counted as residents of the Metropolis, return to rural homes when taken ill, and whose deaths, due in some measure to the evil effects of town residence, are registered in country districts. On this account no correction is made in the death-rate for deaths in the London Hospitals of persons not inhabitants of London; in many of the returns from foreign cities, however, this correction is made by the local authorities, without the addition of the deaths of town residents which occur outside the cities, thus reducing the calculated mortality.

The violent deaths in London were 771 in the quarter, of which 657 were the result of accident or negligence, 77 of suicide, and 22 of murder or manslaughter, including infanticide. The deaths of 53 persons were directly referred to accidents caused by horses or vehicles in the streets; from this class of accidents 716 cases of injury or maiming came under the notice of the Police within the London registration area during the 14 weeks ending 3rd January 1874.

HEALTH OF FOREIGN CITIES.—The following facts relating to Indian or Foreign Cities are derived from official returns furnished by various authorities abroad:

In PARIS the deaths during the quarter were 10,292, and were at the annual rate of 22·3 per 1000; 240 deaths were caused by cholera during October and November. In BRUSSELS the number of persons married was 794, the births were 1549, and the deaths (excluding those of strangers, *i.e.*, of persons not ordinarily resident within the city) 1041; giving rates of 17·2, 33·6, and 22·6 per 1000 respectively; an outbreak of typhoid fever occurred towards the end of the quarter, but the deaths from this disease have shown some decline since the expiration of the quarter. The deaths registered in BERLIN were 5205, and the annual death-rate was 25·2; 179 deaths were referred to cholera, and 166 to diphtheria. In VIENNA 3615 persons, exclusive of strangers, died during the quarter, and

the corresponding death-rate was 22·5; the deaths from small-pox, which had been 735, 286, and 163 in the first three quarters of 1873, rose in the quarter to 236; and in the last week of the year 41 deaths were registered from this disease, a higher number than in any week since March. The deaths from cholera were 193 against 2533 in the previous quarter; they declined from 46 in the week ending 18th October, to one in the week ending 22d November, since which date only one death has been reported. The deaths from typhus showed a considerable decrease from the numbers returned during the previous quarter. In ROME 820 persons were married, 1872 children born, and 1675 persons (excluding strangers) died; the respective rates were 113·4, 30·7, and 27·5; the deaths from fever, which in the first three quarters of 1873 had been 197, 215, and 320, declined in the fourth quarter to 274, equal, however, to an annual rate of 4·5 per 1000 persons living. In FLORENCE there were 752 persons married, 1705 births, and 1277 deaths (excluding those of strangers), giving rates of 18·1, 41·0, and 30·7 respectively; 175 deaths were referred to typhoid fever and diphtheria, showing an increase upon the numbers returned in recent quarters. The returns from TURIN show the number of persons married to have been 780, of births 1689, and of deaths (excluding those of strangers) 1355, and the respective rates were 14·7, 31·9, and 25·5 per 1000, 84 deaths were referred to fever, which was slightly less prevalent than in the two previous quarters. The 1615 deaths in Amsterdam were equal to an annual rate of 23·3, and the 486 deaths in the Hague to a rate of 21·0 per 1000. Returns received from Copenhagen show a total of 1073 deaths, the equivalent annual rate being 21·5.

In the thirteen weeks ending 30th December, 3658 deaths were registered in Bombay, giving a rate of 22·7 per 1000; 1285, or 35 per cent. of the total deaths, were referred to remittent fever, the annual death-rate from this disease being equal to 8·0 per 1000. In Calcutta 3368 deaths were returned in the thirteen weeks ending 27th December, the equivalent death-rate being 30·2; the deaths referred to different forms of fever amounted to 47 per cent. of the total deaths. The 3635 deaths in Madras during the thirteen weeks ending 12th December showed a rate of 36·7; 138 deaths were referred to small-pox.

In New York 6412 deaths were reported in the quarter, and the annual death-rate from all causes was equal to 25·7; no less than 458 were caused by diphtheria, against 186 and 316 in the two previous quarters; 286 deaths resulted from scarlet fever, against 204 in the preceding quarter. The 3030 deaths in Philadelphia were equal to a rate of 16·2 per 1000 annually; 117 deaths were referred to typhoid fever, against 78 and 92 in the two preceding quarters.

THE YEAR 1873.—In the United Kingdom 1,093,893 births and 666,914 deaths were registered during the year 1873; the birth-rate was 34·1 and the death-rate 20·8 per 1000 persons. The excess of births over deaths was 426,979; but the increase to the population thus occasioned was partly counterbalanced by the emigration (from ports at which emigration officers are stationed) of 226,133 persons of British origin, of whom 120,869 were English, 21,564 Scotch, and 83,700 Irish. Of these 226,133 emigrants, 166,461 sailed for the United States, 28,418 for British North America, 25,164 for the Australian Colonies, and 6090 for other destinations.

In England 829,778 births and 492,520 deaths were registered. The births were 3871, and the deaths 255 more than in 1872. The birth-rate was 35·7 and the death-rate 21·2 per 1000, these rates being respectively 0·4 above and 1·4 below the mean rates for the ten years 1863–72. During all the four quarters of the year the marriage-rates were considerably above the average for the ten preceding years.

The 492,520 deaths included those of 123,811 children under one year of age, and of 126,224 persons aged 60 years and upwards; the proportion of the latter was considerably above the average.

The seven principal zymotic diseases were fatal in 68,057 cases, against 88,652 in the previous year. The mortality from these seven diseases was at the rate of 2·9 per 1000 persons living, against 4·5, 4·6, and 3·8 respectively in the three years 1870-1-2. Of these 68,057 deaths, 2332 were caused by small-pox, 7141 by measles, 12,901 by scarlet fever, 2260 by diphtheria, 9039 by whooping-cough, 13,148 by different forms of fever, and 21,236 by diarrhœa. These numbers, derived from the Registrar's Quarterly Returns, are subject to revision when the causes of death in 1873 are finally classified. The subsidence of the small-pox epidemic was the principal cause of the diminished fatality of this class of diseases; the prevalence of scarlet fever and diphtheria, however, in the last quarter of the year caused the mortality from these two diseases to be greater than in 1872. Inquests were held upon the bodies of 26,100, or 5·3 per cent., of the persons whose deaths were registered during the year; and 16,425, or 3·3 per cent., were the victims of various forms of violence, either wilful, or arising from accident or negligence.

HEALTH OF LONDON AND OTHER LARGE CITIES IN 1873.*

LONDON.—The population of London within the tables of mortality is estimated for the middle of the year at *three million three hundred and fifty-six thousand and seventy-three*.

The London of the tables has an area of *one hundred and twenty-two* square miles; it extends down the Thames from Fulham to Woolwich, and climbs the hills to Hampstead on the north, Norwood on the south side of the dividing tidal river crossed by seventeen bridges† and partially fringed by a fine embankment. The mean elevation of the houses above Trinity high-water mark at the last determination was *thirteen* yards; but the elevation ranges from *four* yards *below* in Plumstead Marshes, to *one hundred and forty-three* yards in Hampstead *above* that mark. The hills are higher than the hills of Rome, the river at night reflecting thousands of lights eclipses the Tiber.

The average daily supply of water by eight companies is of 514,269 metric tons taken from the Thames above Teddington Lock, from the tributary Lea, and from deep wells. The daily water supply to houses has increased from 178 gallons in 1872 to 184 gallons in 1873. The supply is virtually a monopoly, and though not now in the hands of any municipal authority, but of companies who are necessarily guided by commercial considerations, has been greatly improved since it was shown in the returns that intermingled sewage impurities diffuse choleraic and other zymotic diseases in an extraordinary manner: the main intakes have been carried higher up the Thames, the filtration has been improved, and in some places the water is supplied on the constant system. Dr. Frankland shows in his excellent report that 648 out of 2525 miles of main are always charged; so that the chief obstacles to the general introduction of a constant supply, facilitating alike the extinction of fires and of disease, are the costly and stringent regulations of the companies. The water of the Thames had 21°, of the Lea 22°, of the Kent Company 29° of hardness. The water supplied by the Kent Company, obtained from deep wells in the chalk, is of a very constant temperature (12°·1 Cent.); it is always clear and transparent, so that by using the softening process, for years in operation in Canterbury and other places, this company might supply water perfectly suitable to all purposes. To the New River, the West Middlesex, and the East London Companies the analyst awards a just meed of praise for their effective filtrations.

The main system of sewers under the engineers of the London Board of Works is approaching completion; so that ere long very little of the sewage will find its way into the Thames within the inhabited area. The chief deficiencies to be supplied are better branch drains in direct communication with the dwellings; and the productive disposal of the sewage for agricultural purposes. The average amount of sewage water pumped into the Thames daily at Crossness and Barking was 555,102 metric tons, which, if skilfully applied, might cover thousands of acres with fertility. How this can be done is the great problem of the day, and must be attacked at once in London and in all the other towns of the kingdom. The flow of sewage is greatest in the first, least in the third quarter of the year.

* Reprinted from the "Annual Summary" for 1873.

† Of these bridges six are for railways. Another bridge is in the process of construction. There are besides, the Thames Tunnel and the Hungerford Bridge for foot passengers.

The smoke nuisance has been partially dealt with ; but it admits of further reduction by operating not only on the furnaces of manufactories but on the kitchen and other fires, where the stoking is far from being so skilful as it might be. Every family creates nuisances by which its neighbours suffer. The recent London fogs have shown, by concentrating it, how fatal foul smoke is to weak lungs.

The meteorological elements of the year were very evenly balanced ; the temperature, the dew-point, the humidity, the rainfall, not only deviated very little from the average of the year, but very little from the average of the respective seasons. The mean temperature of the air was $32^{\circ}\cdot9$ in the coldest week (ending February 8th), $68^{\circ}\cdot8$ in the hottest week (ending July 26th), and $48^{\circ}\cdot9$ in the year. The lowest temperature by night was $22^{\circ}\cdot1$, the highest temperature by day $88^{\circ}\cdot7$. These extremes of temperature increased the deaths registered in the weeks following.

The annual rateable value of property in London is 20 millions ; but it is impossible to say what the income of the inhabitants amounts to : taken as a rough approximation at seven times the rateable value it would amount to 140 millions a year. In the year ended March 1869* the receipts from rates, exclusive of county rates, were 3,730,572*l.* ; including the levies for poor relief 1,509,922*l.*, for vestry expenditure 1,112,218*l.*, for City Corporation and Commission of Sewers 192,514*l.*, for Metropolitan Board of Works 417,305*l.*, for Metropolitan Police 481,744*l.* Besides these rates of a municipal character, the receipts of the 13 Gas Companies for gas rates in the year 1870 were 2,046,974*l.*, while the receipts of the 8 Water Companies for water rates were 991,564*l.*, making the levy of rates by these companies 3,038,538*l.* a year. The revenue of the Gas and Water Companies from all sources was $3\frac{1}{2}$ millions sterling ; the expenditure $2\frac{1}{6}$ millions ; the net profit 1,349,436*l.* The capital of the companies at the latest returns was 18,291,130*l.* ; on which the net profit of 1,349,436*l.* would pay $7\frac{4}{10}$ per cent. Now it is certain that London, with a complete and intelligent municipal organization, could have borrowed money at the rate of $3\frac{1}{2}$ or 4 per cent. ; and had any such organization existed, the gas and waterworks on a combined plan might have been produced for less than 18 millions sterling ; but even at 4 per cent. the capital returned could have been raised at a cost of 731,645*l.* a year, instead of 1,349,436*l.*, with which London is now oppressed : 617,793*l.* would have been free to devote to other purposes ; or a sum exceeding by 200,488*l.* the whole of the rate levied by the Metropolitan Board of Works for the sewers, embankment, and other public works.

Neither water nor gas companies paid such dividends at first as they do now, because the consumption of their products was limited ; but the time has arrived when not only water but gas in towns is recognized universally as a necessary of life ; and both should consequently be supplied by the municipal authorities, wherever, in the opinion of the rate-payers, their mayors and town councils can be trusted to manage the municipal business with as much integrity, intelligence, and zeal for the interests of their fellow townsmen, as the directors of gas and water companies display on behalf of the shareholders.

The great water and gas companies now supply even a wider area than the London within the weekly tables ; and it is evident that while the Lord Mayor on his small domain stood aloof, and the half-trusted vestries wanted intelligence to perceive or to endeavour to supply the new wants of the age, the field was left open to capitalists, who acquired under Acts of Parliament the legal right to levy taxes, of which they can only be deprived by equitable purchase, and by such sacrifices as might be made with ultimate advantage to the inhabitants.

* Board of Trade Miscellaneous Statistics, p. 244.

The people of London in the main gain their own livelihood, and sustain their own poor. How they gain their livelihood is shown to a considerable extent by the Census returns, of which an abstract is supplied. Agriculture, as may be anticipated, is scarcely represented even among the *Males*; but the members of all the professions abound, and amount with their immediate subordinates to 107,130: the commercial, carrying, and warehousing class consists of 211,118; but the class exceeding all the rest is the industrial, numbering 504,772 males under specific employments, without counting 108,379 adult males, including 65,326 general labourers whose occupations are less definite.

Of women there are 630,030 wives, daughters, and others engaged in household duties, or aiding their husbands and parents; and no less than 226,393 domestic servants! 4879 women are schoolmistresses, 11,191 teachers and governesses, 5272 bookbinders, 4360 artificial flower makers, 58,460 milliners or dressmakers, 14,780 tailoresses, 26,875 shirtmakers and seamstresses, 4699 shoe and bootmakers, 10,724 (sewing?) machine workers, 43,998 laundry women; 29,013 women are returned simply as gentlewomen, or annuitants.

The tables of the sexes, ages, and conjugal condition show that of 1,081,973 of the population in 1871 under 15 years of age, the number of males and females is nearly equal; that the number of husbands and wives is 1,128,409; and the number aged 15 and upwards, widowed or unmarried of both sexes, is 1,043,878.

The number of wives 15 and under 45 years of age amounted to 408,837, of widows of the same age to 34,565, of spinsters to 414,851. The wives bore 108,166 registered legitimate children in 1871; the spinsters and widows 4451 registered illegitimate children. As more than one in 4 of the wives bear children annually, the nursing and bringing up of children is a large and important part of their occupation.

Of the 1,081,973 children under 15 years of age, 413,404 were returned as scholars, 617,236 as of no occupation, leaving only 51,333 children of both sexes having specific occupations. This is remarkable. Taking the 309,658 children of 10 and under 15 we have this result: 164,743 were returned as scholars, 93,904 as of no specific occupation, and 51,011 under employments, 10,175 of them being messengers and errand boys. It is evident that a larger number of the unemployed of both sexes should have been at school. Contrast this with Lancashire: there, out of 301,124 children of the age 10—15, no less than 116,564 were employed (59,536 in the cotton manufacture), 142,971 were scholars, and 41,589 were unemployed.

There are no complete returns, such as exist in Paris, of the amount of food consumed by the 3,356,073 inhabitants of London; but we know that it must be large; and that at the same time it comprises but a portion of the necessities and luxuries of life. The daily supply of food by river, canal, road, and railway is in itself a great operation; that is, however, intelligible; but there is an operation of still greater difficulty, and by no means so clear, which London accomplishes, and that is the production of the means of paying for its subsistence. London is self-sustaining; it lives neither on the tribute of the rest of the kingdom, nor on the spoils of provinces as did Rome, its ancient competitor in greatness. The Empire-city, in the words of Mommsen “had to be fed by its subjects;” and 320,000 of its citizens habitually received their dole of bread-corn free, until Cæsar reduced the numbers, by excluding all having means or otherwise provided for, to 150,000. And out of an estimated population of 2,045,000, full 800,000 slaves served the citizens gratuitously in arts, trades, and professions.*

* See Mommsen's *Rome*, English translation, Book V., Chap. xi., and Smith's *Dictionary of Greek and Roman Geography*; Article, *Rome*.

BIRTHS IN LONDON: INCREASE OF POPULATION.—The number of births during the year was 119,015, or 2281 weekly; and as the deaths were 75,459 or 1446 weekly, the excess of births over deaths was 44,466 or 835 weekly. This excess comes near the estimated increase of population, so the actual agrees with the natural increase; but there is a continual outflow of people born in London, and inflow of people born in the rest of the kingdom or abroad. In the census year London contained 1,198,684 persons born outside its limits; while upon the other hand 436,364 people born in London were located in other parts of England and Wales.*

The increase of London in the 10 years 1861–71 was at the rate of 16·1 per cent.; it was 23 per cent. in the West Districts, but all the increase occurred in Chelsea and Kensington, as the population declined in Westminster, and was stationary in the great district of St. George Hanover Square. The North Districts increased by 22 per cent.; but among them Marylebone declined, Pancras increased only 11, while Islington increased 38, Hackney 50, Hampstead 69 per cent. The population of all the Central Districts, extending from the Strand to the City of London, *decreased* 13 per cent. The law courts, railway stations, and offices have displaced dwelling houses; in the day time the offices are filled, but their occupants are properly enumerated at the houses in which they sleep, as there their families live, their children are born, their deaths are for the most part registered. The East Districts, with the exception of Bethnal Green, Mile End Old Town, and Poplar, were stationary or decreasing. The increase of population was greatest in South London, which, low and flat, has benefited so much by the new system of drainage, and lying near the Thames is convenient for many manufacturing processes. Lewisham, Camberwell, and Wandsworth, still thinly inhabited, increased 61, 56, and 78 per cent. in the 10 years preceding the Census.

The density of population in London was such, that there were 25 persons to an acre in 1841, and 42 in 1871; the density in the 30 years doubled in the West, North, and South Districts; in the Central Districts it declined from 172 to 150.

HEALTH OF LONDON: MORTALITY.—The mortality was at the annual rate of 24·2 per 1000 over the 34 years 1840–73; it was as high as 30·1 in 1849, 29·4 in 1854, and 26·5 in 1866, when cholera was epidemic: it was as low as 21·5 in 1872; 22·5 in 1873; the mortality having never been so low for any two consecutive years since 1840, and by fair inference never so low in any two years since London existed. It is a general law that the mortality increases with the density; and this would no doubt have been observed in London, had it not been for the increased purity of the water supply, the new system of drainage which is now, though incomplete, in operation, and some improvement in that most important condition of life—lodging.†

In the last year measles, whooping-cough, and diarrhœa were the ruling zymotic diseases. Fever in its three forms is less fatal than it was in former years; in 1862–65 its victims ranged from 2892 to 3689. In 1873 the deaths by fever were 1549, namely, 284 by typhus, 921 by typhoid or enteric, and 344 by simple continued fever.

The violent deaths show no diminution; they have progressively risen from 2247 in 1861 to 2843 in 1873. There is little increase of homicide or suicide; and a decrease of executions. While one execution excites great feeling, and a murder finds ample reports in the journals, it is left for weekly tables to tell that on an average 45 people of both sexes and

* Census Report, p. xxii., and p. 70.

† See Memorial of the Royal College of Physicians of London to the Right Hon. B. Disraeli.

of all ages are killed by negligence or accident every week in London. The deaths by violence in the streets in five years were 1028. Of this number, 50 deaths were caused in one way or other by horses; 55 by carriages; 94 by omnibuses; 130 by cabs. But these lighter carriages are far outdone by heavy vehicles, often driven unskilfully and without effective breaks; thus 353 persons were killed by vans and wagons; 26 by drays, and 289 by butchers', bakers', and other carts. Goods must be transported from one part of London to another; but the deaths under the car of Juggernaut sink into insignificance by the side of the deaths by vans, wagons, and carts in our own streets. In the last year the tram-carriages killed 17, against 12 killed by omnibuses; they evidently require careful drivers and conductors.

Measles is one of the important zymotic diseases which generally attack children once in their lifetime, and that generally at the ages 0-4. Its activity depends upon circumstances that have not yet been determined. It is therefore all the more important to record, and compare the facts that throw light on the courses of its zymotic development and subsidence.

The mean annual deaths by measles in the 34 years 1840-73 were 1487; seven-times the annual deaths exceeded 2000; and three times they fell below 900. The 52 weeks of 1864 saw 2750 deaths, the highest number; while the 52 weeks of 1852 saw only 600 deaths: the proportions being between 4 and 5 to 1.

Taking weeks, the weekly average was 29; in the cold months of January, February, March the weekly deaths by measles were 25; in the three warm months of July, August, September the weekly deaths were also 25; in the spring quarter they were 30; and in the last quarter of the year 34. This lends no support to the popular medical notion that under this disease cold is more injurious to patients than hot or intermediate temperatures. The seventh week of the year presented the lowest weekly average (20); the fifty-first the highest (43). Deaths from measles were registered in every week of the 34 years; but in one week of each of the years 1841, 1846, 1852, and 1861 only 2 deaths were recorded. On the thirty-first week of 1864 the deaths (102) exceeded 100; but this occurred only once again on any other week up to the forty-fourth of 1873, when the deaths by measles rose to 103; on the forty-seventh week they rose again to 130, and on the fifty-first week to 168. This is therefore the greatest number of deaths by measles in any one week since the year 1840.

THE LONDON OUTER RING.—The area of the outer ring is almost five times as extensive as the central city; and it extends over a circle drawn with a radius of 15 miles from Charing Cross. The population

of the greater London within the circuit is estimated at 4,050,577. Of this population 694,504 belong by estimate to the outer ring.

The social condition of the population outside is different from that of the London of the tables; but the difference in the rates of mortality is chiefly due to the difference of density.

The London water companies and gas companies extend their supply into, and not over the outer ring; but the great drainage system was, it appears, not designed for any Districts outside the jurisdiction of the Metropolitan Board of Works; so as the land becomes covered with population, and, as time flows on, saturated with impurities, the deficiency of drainage will tell seriously on the health of the inhabitants.

The outer ring having no connection with the Metropolitan Board is governed by vestries, and by the *thirty-two* following Sanitary Authorities: Epsom, Croydon, Wimbledon, Kingston, Ham, Surbiton, Malden, East Molesey, Hampton-wick, Teddington, and Richmond, in Surrey; Bromley, in Kent; West Ham, Wanstead, Leyton, Walthamstow, and Woodford, in Essex; Staines, Uxbridge, Twickenham, Ealing, Chiswick, Acton, Harrow-on-the-Hill, Hornsey, South Hornsey, Tottenham, Edmonton, Enfield, Waltham Holy Cross, and Cheshunt, in Middlesex; Barnet in Hertfordshire. Croydon has its own water supply, and an efficient system of drainage, under which it distributes the sewage on farms, which pay a high rental. Efforts in that direction are made by the other Local Boards; but upon the whole these smaller bodies appear to be incapable of dealing effectually with the vast problem which is every year increasing in complexity, and which requires immediate solution. Drainage, water supply, lighting, roads, sanitary arrangements of every kind can only be dealt with effectually by concentrated municipal power armed with adequate authority.

THE EIGHTEEN GREAT ENGLISH TOWNS AND CITIES.—The mortality in the whole population estimated at 6,485,894 was at the annual rate of 24 per 1000. Arranged in the order of mortality the towns stand thus: Portsmouth 18; Norwich 22; London 23; Sunderland 23; Bristol 23; Nottingham 23; Hull 24; Leicester 24; Bradford 25; Birmingham 25; Wolverhampton 25; Oldham and Sheffield 26; Liverpool 26; Leeds 28; Salford 29; Manchester and Newcastle-on-Tyne 30.

THE FIFTY LARGE TOWN DISTRICTS.—Their population is estimated at 2,626,363; and the births registered in the year were 96,317, the deaths 59,803; the excess of births over deaths was 36,514. The birth-rate was 37, the death-rate was 23 in 1000 living.

The mortality was below 18 per 1000 in Dover, Maidstone, and Cheltenham; below 19 in Hastings, Brighton, Reading, Cambridge, Colchester, and Devonport.

The mortality exceeded 30 in Blackburn and Preston; it was, as usual, high in all the Lancashire towns, which have yet a great deal to do ere their inhabitants can enjoy the average health of Englishmen.

REMARKS ON THE METEOROLOGY OF 1873.

By JAMES GLAISHER, Esq., F.R.S., &c.

Atmospheric Pressure.—The readings of the barometer about London, at the level of the sea, was on January 1st, 29·8 in., it increased to 30·16 in. by the 7th; decreased to 29·64 in. by the 9th, was 30·2 in. on the 14th; on the 16th a rapid decrease set in and continued to the 20th, when the lowest reading in the year took place, viz. 28·46 in.; it then turned to increase, and passed the point 30 in. on the 25th, and was about 30·1 in. till the end of January; a decrease set in on February 2nd, and on the 3rd the reading was 29·3 in.; from the 3rd the readings increased, and the point 30 in. was passed on the morning of the 5th, and 30·79 in. was reached on the 18th, this being the highest reading in the year; it then decreased, passing below 30 in. on the 21st, to 29·17 in. on March 1st, from this day to the 26th, the readings were mostly below 30 in., on the 6th and 8th being as low as 29·3 in. and 29·2 in.; from March 26th to the middle of July there was nothing remarkable in the variation of atmospheric pressure, the readings were alternately a little above and a little below their averages for a few days together; the extreme readings were 30·41 in. on May 29th, and 29·39 in. on July 9th. From the middle of July to the middle of August the changes were very small, and all readings were about 30 in.; from the middle of August the readings were below 30 in. to September 2nd; on September 4th the reading was 30·12 in., it decreased to 29·26 in. by the 15th, and increased to 30·54 in. by the 22nd, this being the highest point reached since February 20th. From September 22nd the readings generally decreased to 29·58 in. by October 7th, and after this time they generally increased to 30·52 in. on October 28th. There was then a rapid decrease to 29·13 in. by November 1st, this being a point lower than any since January 24th. From November 1st the reading generally increased, and was 30·48 in. on November 17th; the readings decreased to 29·39 in. by the 22nd, were generally low to the 29th, when 29·57 in. was recorded; a rapid increase then set in, and from December 1st to the 12th the readings remained exceptionally high and steady, and about 30·6 in.; on the 16th the reading was 29·87 in., but increased to 30·22 in. by the 18th, and was about 30 in. till towards the end of the year.

Temperature.—The warm period which set in on December 9th, 1872, continued without interruption till 19th of January 1873, the excess of temperature above their averages on some days exceeding 13°, and for the period (1st to 19th of January) the mean excess of daily temperature was 10°. On the 25th of January a cold period set in, and continued throughout February, the average defect of daily temperature for the period between 25th January and 1st March being 4°; this was succeeded by a week's warm weather, and the excess of daily temperature from 2nd to 9th of March being 3½° nearly; a fortnight's cold weather followed, the average defect of temperature being 3¼° daily. The warm weather which set in a week previous to the close of the preceding month continued till the 5th day of April, the mean excess of temperatures above their averages being 3¼° daily, from the 6th to the 13th the weather was very cold, the wind was mostly N.E., and the depression of temperature below the average was 3½° daily. From the 22nd of April a long cold period set in, and continued below the seasonable average till the 18th day of June, for this long period of 57 days the deficiency of mean temperature was on the average 2¾° daily. Till the 19th of July the weather was cold, and the mean daily temperatures were below their averages by ¾°. On 20th July a sudden change took place, and for a few days, the weather was fine and hot,

immediately following those few warm days beginning 20th July, the weather was again cold, and from 20th July to 2nd September the weather was changeable, being characterised by several days of warm weather, followed by a few days of cold, and then succeeded by several warm days again; the warm days were, however, more numerous, and upon the whole period there was an excess of temperature averaging $2\frac{1}{2}^{\circ}$ on the 45 days ending 2nd of September. From 3rd of September to the end of the month the weather was cold, and the deficiency averaged 2° . From the 7th to the 12th of October the mean temperature was above and below its average alternately. A lengthened cold period set in of more than a month's duration, extending from 12th of October to 16th of November, and the average daily deficiency of mean temperature was $3\frac{1}{2}^{\circ}$, then from 17th of November to 7th of December the weather was mostly warm, and the excess of daily mean temperature was $3^{\circ}\cdot 1$. The mean excess of daily temperature above their averages for the last 17 days of the year was as large as $4\frac{1}{2}^{\circ}$.

Thus January was warm, February was very cold, and low temperatures generally prevailed till the end of May; the months of June, July, August, and September were slightly in excess of their average temperatures; September and October a little below, and November and December a little above their averages.

The temperature rose to $88\frac{3}{4}^{\circ}$ in July, and was $22^{\circ}\cdot 1$ on 10th of December, a day remarkable for its low temperature all over the country, and the middle of three days of extreme low temperatures, and these days in London were distinguished by the presence of a remarkably dense fog, darker in colour, and more dense than I had ever known a fog or cloud to be.

Rain-fall.—Was above its average in the month of January by $0\cdot 56$ in., February by $0\cdot 40$ in., June by $0\cdot 57$ in., August by $0\cdot 82$ in., September by $0\cdot 09$ in., and November by $0\cdot 27$ in.; it was below the average in March by $0\cdot 24$ in., April by $1\cdot 08$ in., May by $0\cdot 60$ in., July by $0\cdot 70$ in., October by $0\cdot 22$ in., and in December by $1\cdot 67$ in. The fall of rain in the year was $23\cdot 36$ in. or $1\cdot 80$ in. below the average annual fall.

The total fall of rain in the year at our stations ranged from $47\cdot 02$ in. at Stonyhurst on 286 days, to $18\cdot 61$ in. at Somerleyton Rectory on 161 days.

PRELIMINARY TABLES.

TABLE 1.—Estimated **Population**, and Number of **Marriages**, **Births**, and **Deaths** registered in **England** in each of the Thirty-six Years **1838–73**.

YEARS ended Dec. 31st	Estimated POPULATION in ENGLAND in the Middle of each Year.*	MARRIAGES.	PERSONS MARRIED.	BIRTHS (exclusive of Still-born).	DEATHS	EXCESS OF BIRTHS OVER DEATHS.

Mean in 36 years	16·5	33·9	22·3	61	30	45

NOTE.—The Table may be read thus:—In the year 1838 to every 10,000 persons living there were 154 persons married, 303 births, and 224 deaths; the number of persons living to every person married, birth or death, was 65, 33, and 45 respectively. The rates in this Table have been calculated upon the estimated populations given in Table 62, but no corrections have been made for the difference between an ordinary year of 365 days and leap year.

TABLE 3.—Marriages in England in each of the Thirty-three Years **1841-73**; those solemnized according to, and not according to, the Rites of the Established Church; with other details respecting the Marriages in the Churches of the Established Church.

Mean Annual Rate per 1000 in each quarter during the 36 years					13·7	16·8	15·9	19·6

Note.—The three months January, February, and March contain 90 days, and in leap year 91 days; the three months April, May, and June 91 days; and each of the last two quarters of the year 92 days. For this inequality a correction has been made in the above calculations.

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 10,000 persons living, 124 persons were married.

TABLE 6.—Marriages in England. The Proportion per Cent. of **Minors** of each Sex, of Males and Females who **signed the Register with Marks**, and of Persons who were **Widowers** or **Widows**, in each of the Thirty-three Years **1841-73.**

Mean Annual Rate per 1000 in each Quarter during the 36 years					35·5	35·1	32·6	32·4

* These rates may thus be read without reference to the decimal points:—In the March quarter of 1838, to 10,000 persons living 303 births were registered. In the calculation of these rates a correction has been made for the varying number of days in the different quarters, see note to Table 5.

1873 -	11,371,273	11,985,141	22·4	19·8	107	113
Average proportion in 36 years, 1838–73 -			23·3	21·4	104	109

The Table may be read thus:—In the year 1838 to every 1000 males living there were 23·4 deaths; to every 1000 females living there were 21·5 deaths; and to each 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males* and *females*; and that out of equal numbers living the deaths of males were as 109 to every 100 deaths of females in 1838.

TABLE 19.—Deaths of 89 Persons RETURNED as Aged 100 Years and upwards in ENGLAND and WALES during the Year 1873.

District Numb.	DISTRICT.	DATE OF DEATH.	PLACE OF DEATH.	SEX.	STATED AGE.	OCCUPATION.	CAUSE OF DEATH.

Note.—The Table may thus be read :—Of each 1000 male children living under five years of age, 72·3 died in each of the 36 years 1838-73 ; in the five years 1841-45 this proportion averaged 69·0 per 1000 ; and in the five years 1866-70 it was 73·0.

* The population used in these calculations is deduced from the ascertained rates of increase observed in the 30 years 1841-71 (*see* Table 62, pp. cxx-i), distributed in the several groups of ages according to the proportions found to prevail at the four Censuses.

1866-70	21·2	63·4	7·4	4·3	7·1	9·6	12·0	15·8	28·0	59·4	136·0	275·7	411·2

Note.—The Table may thus be read :—Of each 1000 female children living under five years of age, 62·4 died in each of the 36 years 1838-73; in the five years 1841-45 this proportion averaged 58·8 per 1000; and in the five years 1866-70 it was 63·4.

* The population used in these calculations is deduced from the ascertained rates of increase observed in the 30 years 1841-71 (see Table 62, pp. cxx-i), distributed in the several groups of ages according to the proportions found to prevail at the four Censuses.

Mean Annual Rate per 1000 in each Quarter during the 36 years					24·9	22·0	20·6	21·9

* These rates may thus be read, without reference to the decimal points:—In the March quarter of the year 1838, to 10,000 of the population 262 deaths were registered. A correction has been made in the calculations for the inequality in the number of days in the different quarters, *see* note to Table 5.

TABLE 29.—Proportional Number of Deaths in England in each Quarter to 1000 Deaths in the Average Quarter* of each of the Thirty-six Years 1838-73.

588	Swansea - - - M -	71,032	3073	1674	43·3	23·6	4·0	St. Cuthbert & St. Mary Sub-dists.

NOTE.—The letter M or P affixed to the name of each Town denotes whether the limits, which the District or Sub-districts in the last column approximately represent, are Municipal or Parliamentary.

* The figures in this column are the numbers enumerated at the Census in April 1871, raised to the middle of 1873 by the addition of 2½ times the annual rate of increase which prevailed between 1861 and 1871. A decrease of population between 1861 and 1871 was shown in Gosport, Devonport, Dudley, Coventry, Macclesfield, and Ashton-under-Lyne; in these instances the enumerated population has been proportionally depressed on the same principle.

† The rates of mortality for these towns have been corrected by the exclusion of a proportional number of deaths occurring in County Hospitals and Lunatic Asylums, situate within the Districts or sub-districts here taken as representing the town, or by the exclusion or addition of a proportion of the deaths in Union Workhouses in cases where a portion of the Union only is embraced by the area taken, or where the Workhouse is situated outside that area.

NOTE.—The deaths in Manchester and Bristol include paupers belonging to those cities who died in Workhouses situated outside the Municipal boundaries.

* The figures in this column, excepting those for Dublin, are the numbers enumerated at the Census in April 1871, raised to the middle of 1873 by the addition of $2\frac{1}{2}$ times the annual rate of increase which prevailed between 1861 and 1871. The population of Dublin is taken as stationary at the number enumerated in 1871.

TABLE 37.—LONDON.—Deaths in Public Institutions in the 52 or 53 Weeks of each of the Thirteen Years 1861–73.*

Average Number living } to One Death annually } (1840-73) }	41	44	44	40	39	41

NOTE.—The populations upon which these rates of mortality have been calculated are deduced from the numbers enumerated at the four Censuses of 1841, 1851, 1861, and 1871. The deaths used are those registered in the complete years.

Certain alterations affecting the West and Central groups of districts were made in the year 1868, but corrections have not been made in the results given in this Table for years prior to 1861.

NOTE.—The numbers for 1837 were registered in the half year ending 31st December.

TABLE 45.—Area, estimated Population, and Marriages, Births, and Deaths registered in the United Kingdom, in the Year 1873.

—	AREA IN STATUTE ACRES.	AREA IN HECTARES.	Estimated POPULATION in the middle of the Year 1873.	MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM	77,635,301	31,416,757	32,124,598	258,075	516,150	1,093,893	666,914
Great Britain - -	56,815,354	22,991,528	26,787,337	232,345	464,690	949,516	569,377
England and Wales -	37,319,221	15,102,008	23,356,414	205,615	411,230	829,778	492,520
Scotland - - -	19,496,133	7,889,520	3,430,923	26,730	53,460	119,738	76,857
Ireland * - - -	20,819,947	8,425,229	5,337,261	25,730	51,460	144,377	97,537

* On the authority of the Registrar General of Ireland it may be assumed that the numbers of marriages, births, and deaths, in that part of the United Kingdom are understated through defective registration.

TABLE 46.—Proportion per 1000 of Marriages, Births, and Deaths to the Population of the United Kingdom, in the Year 1873.

—	ACRES TO A PERSON.	HECTARES TO A PERSON.	TO 1000 PERSONS LIVING.			
			MARRIAGES.	PERSONS MARRIED.	BIRTHS.	DEATHS.
UNITED KINGDOM - -	2·42	·978	8·03	16·1	34·1	20·8
Great Britain - - -	2·12	·858	8·67	17·3	35·4	21·3
England and Wales - -	1·60	·647	8·80	17·6	35·5	21·1
Scotland - - - - -	5·63	2·300	7·79	15·6	34·9	22·4
Ireland - - - - -	3·90	1·579	4·82	9·6	27·1	18·3

Note.—The total area of a country, divided by its population, gives the average area to each person. The reciprocal gives the “density” of the population, or the population to each acre, square mile, or other measure.

TOTAL	1,493,855	5,138,835	1,042,954	196,753	7,871,897
Average annual emigration from the					133,422
United Kingdom					238,909
From 1815 to 1873					-
For the 10 years ending 1873					-

* The Customs' returns do not distinguish the emigration to Australia during the 10 years 1815-24, but it appears from other sources that the emigrants who went to this country were in 1821, 320; in 1822, 875; in 1823, 543; in 1824, 780; and in 1825, 453 persons. These numbers are not included in the totals of this Table.

TABLE 49.—Emigration in 1873.

* The deaths of soldiers, marines, and seamen from the Royal Navy, who were passengers in British Merchant Ships, were 33 in 1856, 59 in 1857, 156 in 1858, 196 in 1859, 196 in 1860, 69 in 1861, 122 in 1862, 116 in 1863, 96 in 1864, 140 in 1865, 184 in 1866, 97 in 1867, 81 in 1868, 51 in 1869, 27 in 1870, 24 in 1871, 1 in 1872, and 6 in 1873. The number is 1,654 in eighteen years, which, if added to the 10,641 above, makes 12,295, the total number of deaths of British subjects at sea in 1856–73, exclusive of those of merchant seamen. The Entries in the "Marine Register" of Births occurring in 1873 were but 80, and of Deaths 245.

* Deduced from a return of the number of accounts of wages and effects of seamen (exclusive of masters) dying before the termination of the voyage, received by the Registrar General of Shipping and Seamen. Since 1867 the return includes seamen dying ashore in foreign parts, whose wages and effects are delivered to the consuls or officers of the hospitals on their discharge from their ships.

If a seaman die on the passage from Sunderland to Calcutta, his death is reported at Calcutta, and his wages and effects are accounted for and transmitted home, if the vessel be not to return direct to the United Kingdom. But if a passenger die on board a ship which does not return to a British port immediately, but trades for a time in foreign parts, considerable delay may occur before his death is reported. In all cases, however, the date is given, and in the accompanying tables the births and deaths are classed according to the years in which they occurred. In some passenger-ships women are employed as stewardesses, and are counted as part of the crew. They therefore form part of the strength in this Table, and if the death of a stewardess occur in the course of a voyage, it is included in the column of Deaths.

When a ship is lost with all persons on board, the owners return the number and names of the crew, and the names of the passengers, when known, to the Registrar General of Shipping and Seamen.

TABLE 61.—RETURN of the AGES, RATING, and CAUSES of DEATHS of 5,393 Seamen reported to the BOARD OF TRADE as having died in the **British Merchant Service** in the Year 1873. (*Parliamentary Return, No. 142, Session of 1874.*)

TABLE 63.

ESTIMATED POPULATION OF THE UNITED KINGDOM,
(including ISLANDS in the BRITISH SEAS)
with Army, Navy, and Merchant Seamen abroad belonging thereto.*

Middle of the Census Years.	PERSONS.	MALES.	FEMALES.
1801 -	16,302,410	8,096,082	8,206,328
1811 -	18,532,522	9,194,348	9,338,174
1821 -	21,300,573	10,519,256	10,781,317
1831 -	24,423,588	12,004,025	12,419,563
1841 -	27,077,095	13,325,889	13,751,206
1851 -	27,764,034	13,656,998	14,107,036
1861 -	29,358,927	14,397,427	14,961,500
1871 -	31,914,985	15,622,725	16,292,260

* In estimating the number of men in the Army, Navy, and Merchant Service abroad, the proportion belonging to foreign countries and the colonies has been excluded. In 1811 the troops and seamen were 640,500, but as this number included natives of colonies and foreign parts, only 502,536 were taken.

The above numbers have been deduced by adding to the estimated population of the United Kingdom, as given in Table 62, the enumerated population of the Islands in the British Seas, and the Army, Navy, and Merchant Service abroad (*see* p. vii. of Vol. I. Census of England and Wales, 1871).

TABLE 64.—Logarithms of the above Populations of the UNITED KINGDOM.

NOTE.—Cholera is given as being chiefly the cause of the high rate of mortality in Denmark in 1853; in Sweden in 1853, 1857, and 1866; in Austria in 1866 and 1873; in Prussia in 1866; in the Netherlands in 1859 and 1866, where also small-pox prevailed in 1871; and in France in 1865 and 1866. War contributed to the same end in Denmark in 1850 and 1864; in Austria in 1866; in Prussia in 1866, 1870, and 1871; and in France in 1870 and 1871.

M. V. Falbe-Hansen remarks that an addition of territory containing a population of about 8000 was made in 1864, and the facts relating to these are shown in this Table from 1860.

* The populations for these years were enumerated at the respective Censuses.

† Cholera was epidemic in the year 1853, and war raged in the years 1850 and 1864.

NOTE.—Previous to 1st January 1860 children who died within 24 hours after birth were counted as still-born.

TABLE 68.—Sweden. Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Years 1850 to 1873.
(Supplied by Dr. Berg, Chief of the Statistical Department of Sweden.)

NOTE.—The Returns for Austria include Hungary, Croatia, Slavonia, and Transylvania from 1853 to 1862 inclusive; since 1862 the returns exclude those portions of the empire. Until 1864 the States of Italy were included; since 1864, however, they are excluded.

* Census years.

† Dr. Ficker attributed the excessive mortality in the year 1866 to Cholera and the war.

‡ Cholera caused the deaths of 107,007 persons in the year 1873.

1873	36,276,000	323,036	646,072	949,230	841,079	17·8	26·2	23·2

NOTE.—The population in the four years 1862-65 and in the years 1867-69 was estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The returns since the year 1860 include the three newly annexed departments. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which they were last domiciled.

* Census years.

† Cholera was prevalent in 1865-66, and war raged in 1870 and 1871.

TABLE 73.—Spain. Population; Number, and Proportion per 1000, of Persons Married, Births and Deaths in each of the Ten Years 1861 to 1870.

1871*	—	—	—	—	—	—	—	—
1872*	—	—	—	—	—	—	—	—
1873*	—	—	—	—	—	—	—	—

NOTE.—The Population enumerated at the Census of 1860 was 15,673,536. The estimated Population for the Years subsequent to 1861 has been deduced from the Excess of Births over Deaths in each Year. The decline of registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred during that year.

* The figures relating to the three years 1871-72-73 are not available, owing to the disturbed state of the country.

TABLE 74.—Italy (inclusive of VENETIA). Population; Number, and Proportion per 1000, of Persons Married, Births, and Deaths, in each of the Eleven Years 1863 to 1873.

(Furnished by Signore L. Bodio, Director of the Italian Statistical Bureau.)

YEARS.	NUMBERS.					PROPORTIONS PER 1000 OF THE POPULATION.		
	ESTIMATED POPULATION, 31st Dec.	MARRIAGES.	PERSONS MARRIED.	BIRTHS. Exclusive of	DEATHS. Still-born.	PERSONS MARRIED.	BIRTHS.	DEATHS.

1867	25,372,780	170,456	340,912	927,396	866,865	13·4	36·5	34·1
1868	25,495,972	182,743	365,486	900,416	777,224	14·3	35·3	30·5
1869	25,734,274	205,287	410,574	952,134	713,832	15·9	37·0	27·7
1870	25,912,600	188,986	377,972	951,495	773,169	14·6	36·7	29·8
1871*	25,964,450	192,839	385,678	960,020	778,798	14·9	37·0	30·0
1872	26,994,338	202,361	404,722	1,020,682	827,498	15·0	37·8	30·7
1873	27,165,553	214,906	429,812	985,188	813,973	15·8	36·3	30·0

NOTE.—The Population was estimated in the following manner: To the population of Italy, exclusive of Venetia, according to the census on 31st December 1861, was added the population of Venetia, according to the Austrian census in 1858, and also the excess of Births over Deaths in each year. No correction was made either for immigration or emigration. The population for 1871 is that enumerated at the census on the last day of December 1871. The population of Rome was first included with that of the kingdom of Italy in 1872.

* Census year.

† The decrease of marriages in 1866 may be attributed to the law which then came into operation removing the civil registration from the parochial authorities to the communes; there had been a marked increase in the previous year resulting from a wish to evade the law about to come into operation. Doubtless many of the marriages solemnized in the churches during 1866 escaped registration.

TABLE 75.—Changes in the Constitution of the Superintendent Registrars' Districts and Registration Sub-districts during the Year 1873.

[The Name of the District is in SMALL CAPITALS, that of the Sub-district in *Italics*. The figures in Cols. 1. and 4. show the number of the District.

Superintendent Registrar's DISTRICT and Registrar's <i>Sub-district</i> from which a Transference was made.	Date of Change.	Place and Population (1871) transferred from the District in Column 1 to the District in Column 4.	Superintendent Registrar's DISTRICT and Registrar's <i>Sub-district</i> to which an addition was made.
No Change was made during the Year 1873 in the Constitution of Registration Districts or Sub-districts.

* The Registration Counties consist of groups of Superintendent Registrars' Districts, which are generally co-extensive with the Poor Law Unions. Those Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal town of the District, or the greater part of the population, is located. The boundaries of Registration Counties

therefore differ more or less from the boundaries of Counties (proper).
† These figures have been furnished to the Registrar General by the Ordnance Survey Department. They do not include space occupied by foreshore or tidal water of rivers and creeks.

the Act of 6 and 7 Wm. IV. c. 86, in the Year ending December 31st, 1873.

† Where the parties to a marriage are of different religious persuasions it sometimes happens that the ceremony is performed according to the rites of both persuasions; in these cases the two ceremonies are entered, as two marriages. This column so includes 62 cases of marriage after divorce, viz., 26 divorced

men who married spinsters, 20 bachelors who married divorced women, 4 divorced men who married widows, 9 widowers who married divorced women, and 3 divorced men who married divorced women. For the districts in which these marriages took place, see Table 10, p. lxxv, of Report.

* The Registration Counties consist of groups of Superintendent Registrar Districts, which are generally co-extensive with the Poor Law Unions. These Districts which extend into two or more Counties (proper) are included entirely in that County in which the principal town of the District, or the greater part of the population, is located. The boundaries of the Registration Counties therefore differ more or less from the boundaries of the Counties (proper).

† These figures have been furnished to the Registrar General by the Ordnance Survey Department. They do not include space occupied by foreshore or tidal water of rivers and creeks.

‡ Some of the births—especially of illegitimate children in London and large towns—escape registration.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1873—continued.

* The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are nearly always identical with the Poor Law Unions of the same names; they are arranged according to their local position under the Registration Counties. The presence of Institutions in any District is indicated in this column of the Table by *H* for Hospital or Infirmary, *L* for Lunatic Asylum, and *w* for Workhouse Establishment receiving inmates from other Districts than the one in which it stands; and repetitions of these letters show the number of such Institutions in any District.

† Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

* The Sub-districts are sub-divisions of Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter W denotes that the Sub-district contains within its limits a Workhouse Establishment belonging to the District or Union; w indicates that a Workhouse Establishment receiving inmates from other Districts than the one in which it stands is included; H indicates a Hospital or Infirmary; L a Lunatic Asylum; and repetitions of any of these letters show the number of such Institutions in each Registration Sub-district.

† Wherever the minus sign (-) is prefixed to the numbers given in the Column headed "Excess of Births over Deaths," it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated. The Excess of Deaths over Births is often attributable to the mortality in Institutions. The Deaths in the principal Institutions of England in 1873 are given on pages 90-118.]

DEATHS IN PUBLIC INSTITUTIONS, 1873.

THE FOLLOWING PAGES contain the numbers of deaths registered during 1873 in most of the public institutions of England. These figures will afford the means of correcting the mortality of districts and sub-districts where affected by the situation therein of these institutions, through the deaths recorded in them. The following list includes all Workhouses, Hospitals, Infirmaries, and public Lunatic Asylums, while prisons, almshouses, schools, private lunatic asylums and benevolent asylums, are excluded. The list, as settled, includes 1299 institutions; of which 720 are Workhouses, Workhouse Infirmaries, or Workhouse Schools; 500 Hospitals or Infirmaries; and 79 Lunatic Asylums. The Lunatic Asylums are mostly County Asylums, but a few private Asylums which receive pauper patients are also included.

Deaths registered in Public Institutions of England in the Year 1873.

NOTE.—The Table may be read thus: Of the 254,985 deaths of Males, 69,195 were those of children under 1 year of age; 19,505 those of the age 1 and under 2 years; 8,346 of the age 5 and under 10 years; 6,001 of the age 15 and under 20 years, and so on.
* This column includes the deaths of 19 males registered as aged 100 years and upwards; namely, 4 aged 100, 1 aged 101, 4 aged 102, and 1 aged 103 years. The districts in which these deaths occurred and the cause of death in each case are stated in Table 12, page lxxxiv, of Report.
The Causes of Death in England and in London, in combination with the Ages at Death, are given at pp. 144-159.

ENGLAND.—SUPPLEMENTARY TABLE of the

[The principles upon which the Causes of Death are tabled have been explained in previous Annual Reports. It will be sufficient to state now that all Diseases are classified in the Tables of Causes of Death, pp. 146-149, under 116 heads; some of these heads, however, include groups of diseases which are very distinct from one another, but which either are fatal to only a few persons, or are often confounded with other diseases. The rule has been to refer the distinct diseases to heads under which the cases were so numerous, that the additional numbers

(continued at page 152.)

CAUSES of DEATH at different Periods of Life, in the Year 1873.

would not materially interfere with the calculated proportions. Where it is desired, partial correction, however, can be made by means of the following Supplementary Table, containing the deaths from many distinct diseases, such as chicken-pox, mumps, &c. &c., which in the preceding Tables, have no separate classification, and also many of the deaths from various forms of disease (such as softening of the brain, *necrencephalus*, deaths from which are included under "*Brain Disease, &c.*") which in some cases are returned under other heads.

Class and Order in the Table of Diseases under which the Cases are entered.		CAUSES OF DEATH.	ALL AGES.	AGES OF FEMALES.

TABLE of CAUSES OF DEATH in ENGLAND 1866-73 as classified by a	
COMMITTEE appointed by the ROYAL COLLEGE OF PHYSICIANS OF	
LONDON	248

APPENDIX.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in
ENGLAND, by W. FARR, Esq., M.D., F.R.S.

YEAR 1873.

SIR,

THE year was less fatal than is usual. Taking population into account the seasons never since the year 1856 saw so few people die. Some of the most pernicious causes of death remained in abeyance, as I now proceed to show in a rapid survey of the facts recorded amply in the Tables.*

The total deaths were 492,520, of which the causes were specified sufficiently for classification in 485,735 instances. Of the cases unclassified 3346 were returned by the coroners and others as sudden or as from causes unascertained: of 3439 the causes were not specified.

I.—ZYMOTIC DISEASES.

The deaths from zymotic diseases were 89,286: making, after correction for unspecified cases, 38·50 per 10,000 of the population.† This is less by 12·36 than the average 50·86 of the twenty years 1850-69. Their mortality, somewhat above the mean in the two years 1870-1, fell in 1872, and again still more in the year 1873.

There are four orders in the zymotic class, and it is in the miasmatic order that the decline has been most sensible. Thus comparing the annual mortality per 10,000 of the twenty-years 1850-69 with that of 1873 the mortality by small-pox fell from 2·04 to 1·02; by measles from 4·37 to 3·19; scarlet fever and diphtheria from 10·46 to 6·76; croup from 2·54 to 1·85; whooping-cough from 5·21 to 4·14; fever in its three forms, in the first years undistinguished, fell from 9·18 to 5·85; dysentery from 0·76 to 0·31. Erysipelas and carbuncle declined. Ague and remittent fever, once so dangerous and causes of so much sickness in England, and still so fatal elsewhere, were fatal to very few lives in 1850-69, and to fewer still in 1873. Rheumatism is stationary. Neither influenza nor cholera was epidemic in 1873: the mortality per 10,000 these diseases occasioned was only 0·11 and 0·32: the actual deaths referred to influenza were 266, to cholera 749. In the years 1847-8-9 the deaths by influenza were 4881, 7963, and 1618; by cholera 788, 1908, and 53,273! By the progress of hygienic measures this country may hope to be spared, for the future, appalling visitations of cholera.

Enthetic diseases occur more frequently than they did some years ago. The deaths by syphilis were 1843: of that number 1470 were children under two years of age. 166 were males and 178 were females of 15

* Tables 1 to 16, pp. 224-247.

† It is convenient in dealing with mortality from classes of diseases, to give the rate per 10,000 to avoid too many decimals. By moving the decimal point one place to the left you have the rate per 1000.

years of age and upwards. Gonorrhœa is rarely fatal directly, but it gives rise to stricture of the urethra, which was the cause of the death of 235 males. Both syphilis and gonorrhœa give rise to local and constitutional diseases of a specific character which is not always indicated in the returns. Hydrophobia assumes the epizootic type in the dog, and the deaths by it have varied in the six years 1868-73 remarkably: they were 7, 18, 32, 56, 39, and 28. To a considerable extent the fatality from this deplorable cause can be restrained by well considered police regulations, 16 who were bitten by mad dogs and died were males, 12 females. One was a boy a year old, and two were girls of the age of four years. Six were boys, two girls of 5-10; three were boys, one a girl, of the age 10-15. Of glanders caught from the horse three men died. That distressing disease is of rare occurrence as few people are exposed to the risk of contagion. In 1855 the deaths by glanders were *eleven*, in 1858 *one*.

The *Dietic* diseases are painful. One of the chief advantages of social organization is the security it affords workmen of all ages against death by starvation; a present and much more pressing danger in a country without Poor Laws than a foreign enemy. Dr. Chambers is probably right when he ascribes many of the atrocities of the first French Revolution and the madness of the Commune to the rage of hunger. The deaths directly referred to privation in England were 71. They are fewer than they were formerly. In 1847, when the potato failed, the deaths in England by privation were 219; what the deaths from this cause may become in a country without a Poor Law, under which the land affords no insurance against death by starvation, the dread famine in Ireland proves.

1162 deaths of infants are ascribed to the want of breast milk and the inanition of infancy.

Rickets is now rarely fatal; but 157 deaths, 155 in children under five years of age, are referred to this cause. Of bronchocele 22 females, and only six males died; all above 10 years of age.

The deaths by delirium tremens were 365, by less aggravated intemperance 412. 330 men, 35 women died of delirium tremens; 286 men, 126 women of intemperance, nearly all at ages above 25, as is the case in insanity. Purpura and scurvy were fatal to 484 persons.

The fatal *parasitic diseases* are due to aphtha, to hydatids, and to worms of various kinds.

II.—CONSTITUTIONAL DISEASES.

85,726 persons died of this class of causes; which, unlike the zymotic class, varies little from year to year. And in the aggregate, notwithstanding the increase of population, there is no sensible increase of the numbers since 1847.

There are two orders, the Diathetic and the Tubercular, the latter being the most fatal.

Gout, the first of the diathetic order of diseases, is growing more fatal: and is generally due to causes over which men have control. Dropsy is now known by practitioners to be often the result of organic diseases which are returned as the causes of death; hence the deaths ascribed to dropsy have declined, but the actual decline of the affection is only apparent. Cancer is the assigned cause of 10,455 deaths.

Scrofula is less fatal than it was ten years ago. Hydrocephalus and tabes mesenterica are nearly stationary. Consumption is returned as the cause of 51,355 deaths: 13,009 of them at the ages 25-35, or in the prime marriage-age of life. 25.6 is the mean age of first marriage for men, 24.2 the mean age of first marriage for women. The rate of mortality in the twenty years (1850-69) by consumption was 26.38, in the last year 22.14. The decline is sensible on such large numbers. This has to be considered in connection with the increase of bronchitis.

III.—LOCAL DISEASES.

Inflammations, hypertrophies, alterations of structure, and functional diseases are essentially diseases of some particular part or organ. At the same time they affect the whole economy more or less, and in so many cases cause death that the third is the most fatal of the five classes. 215,438 deaths are ascribed to local diseases. The mortality by these diseases was at the rate of 92·88 deaths to 10,000 living. Of 100 deaths 44 are by local diseases.

The diseases of the brain, spinal marrow, and nerves constitute the first order. This system is so highly developed in man that it distinguishes him from all inferior animals, and many of its disorders are fatal. 65,835 persons died of diseases of the brain and its appendages, implying a death-rate from this order of causes expressed by 28·38 deaths to 10,000 living. Of the deaths 25,646 are referred to convulsions in children under five years of age. The boys dying in convulsions were 14,448, the girls 11,198. Of the 35,978 dying at the age 5 and upwards 24,211 died of apoplexy and paralysis, the majority of them at advanced ages.

The mortality ascribed to apoplexy is as nearly as possible equal to the mortality by paralysis; the victims of the latter cause being the oldest; and both forms of disease are often concurrent, and are often associated with softening of the brain. The returns of convulsions are decreasing probably from more careful diagnoses; the mortality by cephalitis and insanity is increasing.

Insanity is often the result or the cause of fatal lesions of the brain, but the deaths, even in lunatic asylums, are generally ascribed to other diseases. In fact, as far as is known, a lunatic remains as subject to zymotic, constitutional, and various local diseases as sane people. Insanity is sometimes a consequence, sometimes a cause, of alcoholism.

To heart and arterial diseases 28,447 deaths were referred. The knowledge of these diseases, through modern discoveries, is increasing among medical practitioners, and to this may be referred at least partially the increase in the mortality referred to them from 7·52 in 1850–59 to 12·27.

The most fatal order of local diseases is that embracing diseases of the respiratory organs of which 85,626 persons died, including 51,425 who died of bronchitis and 22,904 who died of pneumonia. Bronchitis has rapidly and progressively increased in the returns; thus in the four quinquennials from 1850 to 1869 the annual deaths by this disease to 10,000 living were 10·16, 13·59, 16·58, 18·39. After the year 1869 there was a further increase, and the mortality in the year 1873 rose to 22·16. Pneumonia declined, but if to avoid confusions of diagnosis, both bronchitis and pneumonia are taken together, there was still an increase in the aggregate, for the annual mortality by both diseases was at the rate of 22·6 in 1850–54 and 32·0 in 1873.

22,314 persons died of diseases of the digestive organs, the mortality showing signs of decrease. Enteritis declined, liver diseases scarcely increased.

There is a general increase in the deaths by urinary diseases; of which 8526 persons died in the year.

Ovarian dropsy is less fatal than it was in former years; this is due to the introduction of one of the most brilliant of surgical operations.

The diseases of the organs of locomotion were fatal to 1973 persons; of the cutaneous integuments to 1439.

IV.—DEVELOPMENTAL DISEASES.

This is an extensive class, and it embraces four orders which must be distinguished. Under the first order 15,950 children died: 10,186 prematurely born; 1491 died of malformations, 4273 of teething.

Under the second order are arranged 2375 deaths in childbirth, exclusive of 1740 by puerperal fever. The deaths are shown for a series of years in Table 13, and are compared with the births of live-born children. It will be noticed with regret that the proportion of deaths of mothers to children implies a higher mortality than has occurred since the years 1864-5; 5 mothers died to 1000 children born alive.*

29,282 persons died of old age; 30,333 died of atrophy and debility, including 22,748 infants under one year of age.

V.—VIOLENT DEATHS.

The deaths of 17,246 persons were registered as caused by violence: in conformity generally with the finding of coroners' inquests, 15,106 of them by accidents, but many really from negligence; 407 by homicide; 1518 by suicide; 9 by execution.

Thus out of 10,000 people, the population of a small town, seven persons (7·44) were killed by obvious causes of various kinds.

Including infanticide, homicide, as defined at inquests, declined after 1865-69; but it increased from 387 in 1872 to 407 in 1873. The criminals convicted for murder were 18; for manslaughter 132.†

Executions have declined since the five years 1860-64 to 1873 from 8 to 4 in ten millions of population.

Suicide has been nearly stationary since the year 1860; the proportion of ascertained suicides to a population of 1,000,000 was 66·6 in 1860-4, 67·2 in the next five years; 70 in 1870, and 66 in each of the years 1871-2, and 65 in 1873.

What are called accidental deaths are often the result of negligence, wilfulness, or rashness. Thus of the 1543 suffocated, 1242 of them children under five years of age; 1145 of them babies in the first year of life, many might have been saved by obvious precautions. It is gratifying to notice a decline of the mortality by burns and scalds from 147 in 1860-4 to 98 in 1873. Further precautions in wearing unflammable dresses, providing escapes from conflagrations, will effect further reductions. The deaths by poisons show a decrease. They are chiefly from laudanum, solid opium, morphia, prussic acid, cyanide of potassium, strychnia, sulphuric acid, carbolic acid, salts of lead, arsenic, overdoses of medicine. Hydrate of chloral and chloroform are new medicines. Chloroform was the cause of 15 deaths; 10 of males, 5 of females.

Fatal doses of none of these poisons should be left about, or in the hands of patients. It is to be feared if this is not attended to, that they will kill more people than they cure. Poisons are not so often as they are believed to be, remedies. They are not all indispensable; and when administered in over-doses they may be fatal.

Registered deaths by drowning were 2695; this is exclusive of 3263 unregistered deaths at sea in the merchant service. Enough care is not yet bestowed on saving life from drowning. Happily the life-boat service is making some progress all round the coast, and by the Act of last session the lives of many seamen will be saved.

7221 deaths were ascribed to fractures and contusions, the direct effects of mechanical force variously applied. More of that force, as compared with the population, exists in England than in any other country; and this loss of life is one of its sad incidental effects. We have not kept pace with its development in guarding against its destructive effects. Let us hope that the multitude of these deaths, and of the innumerable injuries with which they are associated will lead to the discovery of remedies.

* See Tables 10, 11, 12.

† Judicial Statistics, 1873, p. 45.

The same science that creates engines of death may bring to light means of control and safety.

The violent deaths are carefully classified and analysed in the Table.* It will be seen that 1290 deaths were connected with railways, 990 with mines.

The 1290 deaths include those of railway servants. And it is worthy of remark that the number is very nearly the same as the number of deaths by horse conveyances of one kind or other. The deaths on railways may be considered as deaths additional to those incurred in the old conveyances, including wagons, carts, &c. of the country.

To the deaths by lightning the attention of physicists is especially directed. Their distribution over the several districts is given, and in every case the sex, age, and occupation are distinguished. The deaths in each year since 1868 were 11, 7, 19, 28, 46, 21; thus the electrical action of the earth measured by deaths from lightning increased rapidly from 1869, when only 7 persons were killed, to 1872, when 46 were killed by lightning. In the first three years 37, in the last three years 95, were killed.†

The Royal College of Physicians was good enough to appoint a Committee to revise the nomenclature of diseases, and to draw up a report thereon, and I have endeavoured, as far as was practicable, to give the Causes of Death classified according to their nomenclature for the eight years 1866-73, for the sake of comparison in the Table 17.‡

I have the honour to be,

Sir,

Your obedient servant,

WILLIAM FARR.

To

The Registrar General.

NOTE.—For the causes of death in the 5 years 1838–42, see Table 7 in the Appendix to the Thirty-fourth Annual Report. The causes of death were not abstracted for the 4 years 1843–46.
* Order 2, comprising Violent Deaths in Battle is inapplicable to the civil population.
† The number of persons executed in the several years will not necessarily correspond with that returned for the same years in the “Criminal Returns,” inasmuch as the executions recorded in each year are classed in the latter according to the dates of conviction, while the numbers in this Table are placed under the years in which the deaths are registered.

in each of the 27 Years 1847-1873.

* From 1847 to 1857, inclusive, premature birth and infantile debility were abstracted under one heading. In order, therefore, to establish something like uniformity in the above Table, the numbers against each of these separate headings have been estimated from the proportions which the numbers under each bore to the sum of the two in subsequent years, when they were separately classified.

† See note on page 230.

* The rates given in this Table for the various groups of years are the means of the calculated rates in the several years. Under some of the separate headings the means cannot be given for the entire period, as the classification in full detail has not been made during the whole of the 24 years. In a certain number of cases in each year the cause of death is not stated; in calculating the proportional numbers since 1850 these have been distributed pro rata over all the causes in the Table.

† Order 2, comprising Violent Deaths in Battle, is omitted, as inapplicable to the civil population.

TABLE 4.* (continued).—Mean Annual Rate of Mortality in England from each CLASS of CAUSES and from each CAUSE of DEATH during the 20 Years 1850–69, and in each Decade and Quinquenniad of that Period; also the Rate of Mortality in the Years 1870, 1871, 1872, and 1873.

CAUSES OF DEATH.		ANNUAL DEATHS to 1,000,000 LIVING.									
		20 Years 1850-69.	10 Years 1850-59.	10 Years 1860-69.	5 Years 1850-54.	5 Years 1855-59.	5 Years 1860-64.	5 Years 1865-69.	Year 1870.	Year 1871.	Year 1872.

* The populations of these counties have been estimated to the middle of 1873 on the assumption that the rate of increase or decrease which prevailed between the two census enumerations in 1861 and 1871 was maintained up to the middle of 1873; the county totals were then adjusted in order to cast to the estimated total population of England and Wales.

INDEX OF DISTRICTS.

[The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report. The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A.]

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted in the Abstracts for the year 1847, the districts were re-numbered consecutively from 1 to 627 in the Abstracts for the year 1871.*

For names of Towns, such as Leamington, Torquay, &c., which are not found in this "Index of Districts," see the "Index of Sub-districts" (page 271) and "Index of certain Towns" (page 281).

A

Aberayron, 600.
Abergavenny, 579.
Aberystwith, 601.
Abingdon, 114.
Alcester, 398.
Alderbury (Salisbury), 254.
Alnwick, 560.
Alresford, 104.
Alston, 565.
Alton, 105.
Altrincham, 447.
Alverstoke, 88.
Amersham, 139.
Amesbury, 253.
Amptill, 172.
Andover, 109.
Anglesey, 627.
Ashborne, 440.
Ashby-de-la-Zouch, 407.
Ashton-under-Lyne, 468.
Aston, 388.
Atcham (Shrewsbury) 351.
Atherstone, 390.
Auckland, 543.
Axbridge, 315.
Axminster, 269.
Aylesbury, 142.
Aylsham, 223.
Aysgarth, 537.

B

Bakewell, 442.
Bala, 620.
Banbury, 154.
Bangor, 625.
Barnet, 127.
Barnsley, 505.
Barnstaple, 285.
Barrow-upon-Soar, 409.
Barton-upon-Irwell, 464.
Basford, 431.
Basingstoke, 107.
Bath, 317.
Battle, 68.
Beaminster, 267.
Bedale, 535.

Bedford, 170.
Bedminster, 319.
Bedwelty, 580.
Belford, 561.
Bellingham, 558.
Belper, 439.
Berkhamstead, 138.
Berwick, 562.
Bethnal Green, 15.
Beverley, 518.
Bicester, 150.
Bideford, 287.
Biggleswade, 171.
Billericay, 190.
Billesdon, 403.
Bingham, 436.
Birkenhead, 454.
Birmingham, 387.
Bishop Stortford, 130.
Blaby, 404.
Blackburn, 474.
Blandford, 260.
Blean, 57.
Blofield, 228.
Blything, 216.
Bodmin, 294.
Bolton, 462.
Bootle, 573.
Bosmere, 211.
Boston, 418.
Bourn, 415.
Brackley, 155.
Bradfield, 117.
Bradford-on-Avon, 249.
Bradford (Yorkshire), 496.
Braintree, 199.
Bramley, 499.
Brampton, 567.
Brecknock, 604.
Brentford, 125.
Bridge, 55.
Bridgend, 586.
Bridgnorth, 348.
Bridgwater, 307.
Bridlington, 524.
Bridport, 268.
Brighton, 76.
Bristol, 320.
Brixworth, 161.
Bromley, 40.

Bromsgrove, 385.
Bromyard, 341.
Buckingham, 145.
Builth, 603.
Burnley, 472.
Burton-upon-Trent, 368.
Bury, 463.
Bury St. Edmunds, 206.

C

Caistor, 425.
Calne, 245.
Camberwell, 25.
Cambridge, 178.
Camelford, 290.
Canterbury, 56.
Cardiff, 583.
Cardigan, 597.
Carlisle, 569.
Carmarthen, 593.
Carnarvon, 624.
Castle Ward, 555.
Catherington, 102.
Caxton, 176.
Chapel-en-le-Frith, 443.
Chard, 309.
Cheadle, 366.
Chelmsford, 191.
Chelsea, 2.
Cheltenham, 335.
Chepstow, 577.
Chertsey, 30.
Chester, 452.
Chesterfield, 441.
Chester-le-Street, 549.
Chesterton, 177.
Chichester, 83.
Chippenham, 244.
Chipping Norton, 153.
Chipping Sodbury, 322.
Chorley, 475.
Chorlton, 465.
Christchurch, 92.
Church Stretton, 346.
Cirencester, 331.
Cleobury Mortimer, 347.
Clifton, 321.
Clitheroe, 473.

* Thus, the number of Marriages in the Aberayron District may at once be ascertained by referring to the "*Abstract of Marriages*," District number 600 (see page 24); and the numbers of Births and Deaths, of Deaths at different Ages, &c. will be found by referring to the same district number in the respective Tables.

Clun, 345.
 Clutton, 316.
 Cockermouth, 571.
 Colchester, 195.
 Congleton, 450.
 Conway, 626.
 Cookham, 120.
 Corwen, 619.
 Cosford, 204.
 Coventry, 393.
 Cranbrook, 51.
 Crediton, 282.
 Crickhowell, 605.
 Cricklade, 242.
 Croydon, 37.
 Cuckfield, 74.

INDEX OF SUB-DISTRICTS.

[This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus, Abbey Holme (570; 2) is the 2d Sub-District of the Wigton District, No. 570.]

SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.	SUB-DISTRICT.	DISTRICT.	No.
A			Ardleigh . . .	Tendring . . .	194; 5	Baschurch . . .	Ellesmere . . .	354; 4

ALPHABETICAL INDEX

TO

REGISTRAR-GENERAL'S THIRTY-SIXTH ANNUAL
REPORT AND APPENDIX.

	PAGES
AGES ; of Persons married in 1873	viii-ix
Mean Age at Marriage	viii-ix
Deaths of Males and Females registered at different Ages in England in each of the Years 1838-73. (Tables 20, 21, pp. lxxxv, lxxxvi.)	xiv-xv
Mortality of Males and Females at different Ages in England in the Years 1838-73. (Tables 22-25, pp. lxxxvii-xc.)	xiv-xv
Mortality of Persons, Males and Females, at 12 groups of Ages in Divisions and Counties. (Tables 26, 27.)	xc-i-xcii
of 300,262 Persons married in 1873, distinguishing Bachelors, Spinners, Widowers, Widows	26-28
at Death of Males and Females registered in 1873 in Divisions, Counties, and Districts	120-141
at Death of Males and Females in England registered from different Causes, in 1873	144-149
at Death of Males and Females in England registered from different Supplemental Causes, in 1873	150-153
at Death of Males and Females in London registered from different Causes, in 1873	154-159
(See also MARRIAGES, BIRTHS, and DEATHS.)	
ALCOHOLISM. (See INTEMPERANCE and DELIRIUM TREMENS.)	
APPENDIX TABLES	224-265
AREA in Statute Acres of each Division, County, District, and Sub-district	30-84
of the Islands in the British Seas. (Table 47.)	cx
in Acres and Hectares of the United Kingdom in 1873. (Table 45.)	cix
ARMY ; Strength and Mortality of the Army at Home and Abroad. (Tables 51-58, pp. cxiv-cxvi.)	xix
Average Strength of the British Army at Home in 1873. (Table 51, p. cxiv.)	xix
Average Strength and Proportion per cent. of the British Army at Home and Abroad in each of the Years 1861-73. (Table 52, p. cxiv.)	
Mortality of the Army at Home in 1873. (Table 53, p. cxiv.)	xix
Average Strength of the British Army Abroad in each of the Years 1870-73. (Table 54.)	cxv
Number of Deaths in the British Army at Home and Abroad, 1870-73. (Table 55.)	cxv
Annual Rate of Mortality per 1000 amongst Officers and Men in the Army at Home and Abroad, 1858-73. (Table 56.)	cxv
Strength at Home and Abroad in 1861 and 1871, showing the Numbers and Proportion per cent. born in the different parts of the United Kingdom and elsewhere. (Table 57.)	cxvi
Deaths in Army Abroad of Officers and Men belonging to Great Britain and to England and Wales, 1858-73. (Table 58.)	cxvi

	PAGES
AUSTRIA; Average Annual Proportion to Population of Persons married, Births, and Deaths, 1853-73	xxii
Marriage, Birth, and Death Rates compared with those of other European States. (Table 65.)	cxxiii
Estimated Population; Number, and Proportion to Population, of Persons married, Births, and Deaths, in each of the Years 1853-73. (Table 69.)	cxxv
 BIRTHS in 1873	xi
out of Wedlock, proportions in Eleven Years, 1863-1873	xii
in quarter ending March 1873	xxvi-xxvii
in quarter ending June „	xxxiv
in quarter ending September „	xli-xlii
in quarter ending December „	xlix-l
registered in England, and excess over Deaths, in each Year, 1838-73. (Table 1.)	lxvi
Legitimate and Illegitimate in England in 1842 and in the Years 1845-73, and Proportion of Males to Females. (Table 11.)	lxxvi
proportion of Illegitimate Children to every 100 Births in the several Counties of England in each of the Years 1863-73. (Table 12.)	lxxvii
registered in England in each Quarter of the Years 1838-73. (Table 13.)	lxxviii
proportional Number of Births in each Quarter to 1,000 Births in the average Quarter of the Years 1838-73. (Table 14.)	lxxix
in Counties, in 1873. Numbers, Sex, Legitimate and Illegitimate; Proportions of Male to Female Births, Legitimate and Illegitimate; Proportion of Illegitimate Births to Total Births. (Table 15.)	lxxx
proportion of Male and Female Children born in the several Counties of England during each of the Years 1863-73. (Table 16.)	lxxxi
in Fifty large Town Districts in 1873. (Table 35.)	xcix
in Twenty-one large Towns of the United Kingdom in 1873. (Table 36.)	c
in London in the Years 1861-73, distinguishing Males and Females. (Table 39.)	cii
in the United Kingdom in 1873. (Table 45.)	cix
in the Islands of the British Seas in the Years 1851-73. (Table 47.)	cx
of British Subjects at Sea, in the Years 1856-73. (Table 59.)	cxvii
registered in each of the Divisions, Counties, Districts, and Sub-districts in 1873, distinguishing Males and Females and the Illegitimate	30-84
excess over Deaths in each of the Divisions, Counties, Districts, and Sub-districts in 1873	30-84
registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1873	86-89
of Children born out of Wedlock registered in the Divisions and Counties (distinguishing Males and Females) in each of the Four Quarters of 1873	90-93
in Foreign States. (See FOREIGN STATES.)	
illegitimate. (See ILLEGITIMATE BIRTHS.)	

	PAGES
BIRTH-RATE in England in 1873	xi
in England in each of the Years 1838-73. (Table 2.)	lxvii
in England in each Quarter of the Years 1838-73. (Table 13.) .	lxxviii
in Counties in each of the Years 1863-73. (Table 17.)	lxxxii
in Fifty large Town Districts in 1873. (Table 35.)	xcix
in Twenty-one large Towns of the United Kingdom in 1873. (Table 36.)	c
in the United Kingdom in 1873. (Table 46.)	cix
in Foreign States. (<i>See FOREIGN STATES.</i>)	
BRAIN DISEASES; Fatality and Mortality	221
BRONCHITIS; Mortality from	221
rapid increase; Mortality in four Quinquennials, 1850-69, and in 1873	221
BURNS AND SCALDS. (<i>See VIOLENT DEATHS.</i>)	
CAUSES of DEATH; of Seamen in the British Merchant Service in 1873. (Table 61.)	cxix
of Males and Females in England, at different Periods of Life, in 1873	144-149

Comparative mortality from, in the 20 Years 1850-69	219
SPAIN ; Average Annual Proportion to Population of Persons married, Births, and Deaths, 1861-70	xxii
Marriage, Birth, and Death Rates compared with those of other European States. (Table 65.)	cxxiii
Estimated Population ; Number, and Proportion to Population, of Persons married, Births, and Deaths in each of the Years 1861-70. (Table 73.)	cxxvii

	PAGES
STARVATION ; Deaths from, in the Six Years 1868-73, distinguishing Localities, Sexes, and Ages. (Table 10.—App.)	242
SUB-DISTRICTS ;	
No changes in the nomenclature of, during 1873. (Table 75.)	cxxviii
Alphabetical Index of	271-280
SUICIDES of Males and Females in England at different Ages during the Year 1873	206-207
of Males and Females in each of the Eleven Divisions during the Year 1873	208-209
Proportion to every 1,000,000 of the Population of England, 1858-73. (Table 2.—App.)	230, 232
SWEDEN ; Average Annual Proportion to Population of Persons married, Births, and Deaths, 1853-73	xxii
Marriage, Birth, and Death Rates compared with those of other European States. (Table 65.)	cxxiii
Population ; Number, and Proportion to Population, of Persons married, Births, and Deaths, 1850-73. (Table 68.)	cxxv
SYPHILIS, Deaths from	219-220
TEMPERATURE ; Mean at Greenwich in each week of 1873. (Table 34.)	xcviii
Mean in 1873 in 21 large Towns of United Kingdom. (Table 36.)	c
(See also METEOROLOGY.)	
TOWN AND COUNTRY DISTRICTS ; Mortality in 1873	xvi
Mortality in quarter ending March 1873	xxviii
in quarter ending June „	xxxv
in quarter ending September „	xlili-xliv
in quarter ending December „	li
Area ; Population 1861 and 1871 ; Annual Rate of Mortality per 1000 in each Quarter of the Years 1863-73. (Table 31.)	xcvi
TOWNS ; Mean Temperature at Greenwich, Annual Rate of Mortality in each week of 1873, in London and 20 other large Towns of the United Kingdom. (Table 34.)	xcviii
Population, Births, Deaths ; Birth and Death Rates in 1873 in Fifty large Town Districts. (Table 35.)	xcix
Population, Births, Deaths ; Birth and Death Rates ; Temperature and Rainfall in 1873, in London and Twenty large Towns of the United Kingdom. (Table 36.)	c
Mortality in large English Towns in 1873. (Tables 15-16, App.)	247
Index of certain Towns whose names differ from those of the District and Sub-district in which they are respectively situated	281
TYPHUS, TYPHIA, TYPHINIA. (See FEVER.)	
UNITED KINGDOM ; Population and Emigration in 1873	xviii
Marriages, Births, and Deaths, in quarter ending March 1873	xxvi
in quarter ending June „	xxxliii
in quarter ending September „	xli
in quarter ending December „	xlix
Area, Estimated Population, Marriages, Births, and Deaths, in the Year 1873. (Table 45.)	cix
Proportion, per 1000, of Marriages, Births, and Deaths to the Population in 1873. (Table 46.)	cix

UNITED KINGDOM—*continued.*

	PAGES
Emigration in each of the Years 1815-73. (Table 48.) . . .	cxī
Emigration in the Year 1873, distinguishing the Destination, Sex, Age, Condition, Occupation, and Origin of the Emigrants. (Tables 49, 50.)	cxii-cxiii
Estimated Population of both Sexes, distinguishing England, Scotland, and Ireland, in the middle of each of the Years 1801-75, <i>excluding the Islands in the British Seas, Army, Navy, and Merchant Seamen Abroad.</i> (Table 62.)	cxx-cxxi
Estimated Population of both Sexes (<i>including the Islands in the British Seas, Army, Navy, and Merchant Seamen Abroad</i>) in the middle of the Years 1801, 1811, 1821, 1831, 1841, 1851, 1861, and 1871, and the Logarithms of the same. (Tables 63, 64.)	cxxii
 VIOLENT DEATHS of Males and Females in England at different Ages during the Year 1873	196-200
of Males and Females in each of the Eleven Divisions during the Year 1873	201-205
in 1873	222-223
in Mines and on Railways.	223
 VITAL STATISTICS of European States. (Tables 65-74.)	cxxiii-cxxviii
 WEATHER. (<i>See METEOROLOGY.</i>)	
WHEAT; Average Price of, 1852 to 1873. (Table 33.)	xcvii
WILLS; Calendars of, kept at the General Register Office, where searches may be made	xxii
 ZYMOTIC DISEASES	219-220
Summary of Quarterly Reports	xxvi-lvi
Death-rate from seven zymotic diseases in Fifty large Town Districts in 1873. (Table 35.)	xcix
Death-rates from, in 18 of the largest English towns in 1873. (Table 16.—App.)	247
Causes of Deaths in England	144-149
" " London	154-159
" " Divisions and Counties	160-183
Deaths from several causes in Divisions, Counties, and Districts	184-195
Deaths from, in each Year, 1847-73	224-225
Deaths from, to 1,000,000 Persons living in each Year 1858-1873. (Table 2.—App.)	230
Deaths from; proportional number in 1,000,000 deaths in 1873. (Table 3.—App.)	233
Mean annual rate of mortality from, during 20 years 1850-69, and in each Decade and Quinquenniad of that period. (Table 4.—App.)	234
Death-rates from, and certain other diseases in Counties. (Table 6.—App.)	239
(<i>See also under names of several Zymotic diseases.</i>)
